Overview of the Grand Canyon

The Grand Canyon is a profound geological feature carved over millions of years by the Colorado River within the Colorado Plateau in northern Arizona. Stretching approximately 277 miles (446 km) in length, it varies in width from 4 to 18 miles (6.4 to 29 km), and reaches depths of over 6,000 feet (1,800 meters). The uplift of the Colorado Plateau, commencing around 65 million years ago, elevated the region significantly, increasing the gradient and flow of the Colorado River. This uplift, combined with the erosive power of the river and its tributaries, carved out the deep and expansive canyon we see today.

Erosional Processes

- River Erosion: The primary force shaping the canyon, constantly cutting into rock layers.
- Mass Wasting: Landslides and rockfalls contribute to the canyon's ongoing evolution.
- Weathering: Physical and chemical weathering break down rocks, creating the dramatic cliffs, spires, and buttes.
