Question: Explain the bonding in a water molecule and how its shape influences its properties.

Sample Answer:

Water (H_2O) exhibits covalent bonding, where each hydrogen atom shares electrons with the oxygen atom, resulting in a bent molecular shape. According to VSEPR theory, the oxygen atom has two lone pairs and two bonding pairs, leading to a bent geometry with an approximate bond angle of 104.5° . This shape results in a polar molecule with a partial positive charge near hydrogen atoms and a partial negative charge near oxygen, creating a dipole moment.

This polarity influences water's high boiling point, surface tension, and solvent properties. The bent shape also allows for hydrogen bonding between water molecules, contributing to its unique physical properties and its role as a universal solvent.
