The common diagnostic criteria include persistent depressed mood, loss of interest or pleasure in activities, significant weight change, sleep disturbances, psychomotor agitation or retardation, fatigue, feelings of worthlessness or guilt, difficulty concentrating, and recurrent thoughts of death or suicide, as outlined in the DSM-5 and reflected in HESI case scenarios. How should nursing interventions be prioritized in a HESI case study involving Major Depressive Disorder? Nursing interventions should prioritize ensuring patient safety (especially preventing suicide), providing emotional support, administering prescribed medications (such as antidepressants), promoting sleep hygiene, and encouraging participation in therapy, with safety and stabilization being the top priorities. What are key signs of suicidal ideation to look for in a HESI case study of a patient with Major Depressive Disorder? Key signs include expressions of hopelessness, giving away possessions, withdrawal from social activities, talking about death or dying, recent hopeless statements, and any mention of feeling like a burden or having no reason to live. In HESI case studies, what are effective patient teaching points for managing Major Depressive Disorder? Effective teaching includes explaining the importance of medication adherence, recognizing side effects, encouraging participation in therapy, establishing a routine, maintaining a support system, and alerting the nurse if suicidal thoughts or worsening symptoms occur. What are common pharmacologic treatments for Major Depressive Disorder highlighted in HESI case studies? Common treatments include selective serotonin reuptake inhibitors (SSRIs) like fluoxetine, sertraline, or citalopram; serotonin-norepinephrine reuptake inhibitors (SNRIs); atypical antidepressants; and sometimes mood stabilizers or antipsychotics, depending on the severity and presentation of symptoms.
