Working Principle of an Instrumentation System Using Block Diagram

The operation of an instrumentation system can be understood sequentially through its block diagram:

Step 1: Measurement via Sensor

The process begins with the sensor detecting the physical quantity (e.g., temperature) and converting it into an electrical signal proportional to the measured parameter.

Step 2: Signal Conditioning

The raw signal from the sensor is often weak or noisy. The conditioning circuit amplifies and filters the signal, ensuring it is clean, stable, and suitable for processing.

Step 3: Signal Processing

The conditioned signal is then fed to a processing unit, typically a microcontroller or digital processor, which interprets the data, performs calculations, and converts it into a standard digital format if necessary.

Step 4: Display and Control

The processed data is displayed for the operator's reference. In automated systems, the data may be used to actuate control elements, adjusting process variables to desired setpoints.

Step 5: Feedback and Adjustment

In closed-loop systems, the control element receives signals from the processing unit and makes adjustments to maintain the process variable at the desired level.

Types of Instrumentation Systems Based on Block Diagram Structure

Instrumentation systems can be classified into various types, primarily based on their feedback mechanisms and processing methods.

Open-Loop Instrumentation System
