Analyzing Sample Questions from the June 2013 Past Paper

Let's explore some example questions from the 2013 paper, providing insights into how to approach them effectively.

Section B: Short Answer Question Example

Question:

Describe the process of active transport across a cell membrane and explain how it differs from diffusion.

Approach and Tips:

- Define active transport as the movement of molecules against their concentration gradient using energy (ATP).
- Explain the involvement of specific carrier proteins.
- Contrast with diffusion, which is passive and moves molecules down their concentration gradient.
- Use diagrams if possible to illustrate the process.

Sample Answer Highlights:

Active transport requires energy input, involves carrier proteins, and allows cells to accumulate substances against concentration gradients. Diffusion is a passive process that relies on kinetic energy, with no energy expenditure, and occurs down the concentration gradient.

Section C: Data Interpretation and Extended Response Example

Question:

Using the data provided in the table on plant transpiration rates, analyze how environmental factors influence transpiration and suggest methods to reduce water loss in crops.

Approach and Tips:

- Carefully interpret the data, noting trends related to humidity, temperature, and light intensity.
- Discuss how increased temperature and light can increase transpiration.
- Consider the role of humidity in decreasing transpiration.
- Suggest practical methods, such as shading or applying antitranspirants, to reduce water loss.

Sample Answer Highlights:

Environmental factors like high temperature and intense light increase transpiration by creating a steeper water potential gradient. Higher humidity reduces transpiration. To minimize water loss, farmers can use shade nets, maintain optimal irrigation, or apply antitranspirant sprays.
