This comprehensive guide aims to provide well-structured explanations, step-by-step solutions, and key concepts related to dilation problems, ensuring students can confidently approach similar questions in their studies.

Introduction to Dilations

Dilations are transformations that produce an image that is the same shape as the original but is either enlarged or reduced. The key components involved in dilations include the center of dilation and the scale factor.

What is a Dilation?

- A geometric transformation that creates an image similar to the original.
- Changes the size of a figure but preserves its shape.
- The figure is scaled relative to a fixed point called the center of dilation.

Key Terms in Dilations

- **Center of Dilation:** The fixed point about which the figure is scaled.
- **Scale Factor:** A number that determines how much the figure is enlarged or reduced.
- **Image:** The resulting figure after dilation.
- **Pre-image:** The original figure before dilation.

Understanding the Scale Factor

The scale factor is crucial in determining the nature of the dilation:

- Scale factor > 1 : The figure enlarges (dilation).
- Scale factor $= 1$: The figure remains unchanged.
- Scale factor between 0 and 1: The figure reduces (contraction).

Calculating the Scale Factor

When given coordinates, the scale factor can be found by:

- Measuring the distance from the center of dilation to a point on the pre-image.
- Measuring the distance from the center to the corresponding point on the image.
- Dividing the image distance by the pre-image distance:

Scale factor = (Distance from center to image point) / (Distance from center to pre-image point)

Step-by-Step Approach to Solving Dilation Problems

To solve dilation problems effectively, follow these steps:

Step 1: Identify the Center of Dilation

- Usually given in the problem.
- If not given, determine it based on the figure or problem context.

Step 2: Determine the Coordinates of Pre-image and Image Points

- Use the coordinate plane to record points.

Step 3: Calculate Distances from the Center to Points

- Use the distance formula:

$$\text{Distance} = \sqrt{(x_2 - x_1)^2 + (y_2 - y_1)^2}$$

Step 4: Find the Scale Factor

- Divide the distance from the center to the image point by the distance from the center to the pre-image point.

Step 5: Apply the Dilation Rules to Find Missing Coordinates

- For each point, multiply the vector from the center to the pre-image by the scale factor.
- Add this scaled vector to the center's coordinates to find the image point.

Step 6: Verify the Dilation

- Check if the distances or ratios align with the scale factor.
- Confirm that the figure is similar and proportionally scaled.

Sample Problems and Solutions

Problem 1: Basic Dilation with Coordinates

Given: Center of dilation at (2, 3), original point at (4, 7), scale factor = 2.

Solution:

- Find the vector from the center to the pre-image:

- $x = 4 - 2 = 2$

- $y = 7 - 3 = 4$

- Multiply by the scale factor:

- $x' = 2 \cdot 2 = 4$

- $y' = 4 \cdot 2 = 8$

- Find the image point by adding scaled vectors to the center:

- $x' = 2 + 4 = 6$

- $y' = 3 + 8 = 11$

Answer: The image point is at (6, 11).

Problem 2: Reduction Dilation

Given: Center at (0, 0), pre-image at (6, 8), scale factor = 0.5.

Solution:

- Vector from center:

$$- \Delta x = 6$$

$$- \Delta y = 8$$

- Multiply by scale factor:

$$- \Delta x' = 6 \cdot 0.5 = 3$$

$$- \Delta y' = 8 \cdot 0.5 = 4$$

- Image point:

$$- x' = 0 + 3 = 3$$

$$- y' = 0 + 4 = 4$$

Answer: Image point at (3, 4).

Problem 3: Finding the Scale Factor Given Coordinates

Given: Center at (1, 1), pre-image at (3, 4), image at (5, 7).

Solution:

- Distance from center to pre-image:

$$- \sqrt{(3 - 1)^2 + (4 - 1)^2} = \sqrt{4 + 9} = \sqrt{13} \approx 3.605$$

- Distance from center to image:

$$- \sqrt{(5 - 1)^2 + (7 - 1)^2} = \sqrt{16 + 36} = \sqrt{52} \approx 7.211$$

- Scale factor:

$$- 7.211 / 3.605 \approx 2$$

Answer: The scale factor is approximately 2.

Sample Problem and Its Solution

Problem: Given a triangle with vertices $A(2, 3)$, $B(4, 7)$, and $C(6, 3)$, find the image of triangle ABC after a dilation centered at $(2, 2)$ with a scale factor of 2.

Solution:

- Identify the center of dilation: $C(h, k) = (2, 2)$.
- Apply the dilation formula to each vertex:
- For $A(2, 3)$:

$\quad$

$$x' = h + r(x - h) = 2 + 2(2 - 2) = 2 + 0 = 2$$

\\

\\

$$y' = k + r(y - k) = 2 + 2(3 - 2) = 2 + 2(1) = 2 + 2 = 4$$

\\

Image of A: \\(A'(2, 4) \\).

- For \\(B(4, 7) \\):

\\

$$x' = 2 + 2(4 - 2) = 2 + 2(2) = 2 + 4 = 6$$

\\

\\

$$y' = 2 + 2(7 - 2) = 2 + 2(5) = 2 + 10 = 12$$

\\

Image of B: \\(B'(6, 12) \\).

- For \\(C(6, 3) \\):

\\

$$x' = 2 + 2(6 - 2) = 2 + 2(4) = 2 + 8 = 10$$

\\

\\

$$y' = 2 + 2(3 - 2) = 2 + 2(1) = 2 + 2 = 4$$

$\setminus$

Image of C: $\setminus (C'(10, 4) \setminus)$.

Question What is the main concept covered in Lesson 4 Homework Practice on dilations? Lesson 4 focuses on understanding how dilations expand or shrink figures by a scale factor, including identifying centers of dilation and applying the rules to various geometric shapes. How do you find the image of a point after a dilation with a given center and scale factor? To find the image of a point after dilation, draw a line from the center of dilation to the point, measure the distance to the image by multiplying the original distance by the scale factor, and plot the new point along the same line. What are common mistakes to avoid in homework practice on dilations? Common mistakes include forgetting to identify the correct center of dilation, mixing up the scale factor's direction (enlarging vs. reducing), and incorrectly calculating the new coordinates of points. Can you explain how to determine if a dilation is an enlargement or a reduction? Yes, if the scale factor is greater than 1, the dilation is an enlargement; if it's between 0 and 1, it's a reduction. A scale factor of exactly 1 results in no change to the figure. Where can I find detailed answers and explanations

Understanding Geometry Rotations and Dilations

Before diving into practice problems, it's essential to grasp the fundamental concepts of rotations and dilations. This section offers a concise overview to ensure a solid foundation.

What Is a Rotation?

A rotation is a transformation that turns a figure around a fixed point, called the center of rotation. The figure is rotated by a specific angle, either clockwise or counterclockwise, without changing its size or shape.

Key components of rotation:

- Center of rotation: The fixed point about which the figure is rotated.

- Angle of rotation: The degree measure of the turn, such as 90° , 180° , or any arbitrary angle.
- Direction: Usually clockwise or counterclockwise.

Properties of rotations:

- Distance from the center remains unchanged.
- The size and shape of the figure stay the same.
- The rotation is an isometry (distance-preserving transformation).

What Is a Dilation?

A dilation is a transformation that produces a similar figure, scaled up or down from a fixed point called the center of dilation.

Key components of dilation:

- Center of dilation: The fixed point from which the figure is scaled.
- Scale factor (k): Determines the size of the image relative to the original.
- If $|k| > 1$, the figure enlarges.
- If $|k|$
- If $k = 1$, the figure remains unchanged.

Properties of dilations:

- Similarity: The image is similar to the original figure.
- Angle measures remain the same.
- Side lengths are scaled proportionally.

Essential Skills for Practice Mastery

To effectively solve problems involving rotations and dilations, students should develop skills in:

- Identifying centers of rotations and dilations.
- Calculating the angle of rotation.
- Determining scale factors.
- Applying coordinate geometry for precise transformations.
- Recognizing similar figures and proportional sides.

Practice Problems for Geometry Rotations

This section contains a series of practice problems designed to reinforce understanding of rotations.

Basic Rotation Problems

- Rotate a Point About the Origin

- Problem: Find the image of point $P(3, 4)$ after a 90° counterclockwise rotation about the origin.

- Solution:

- Use the rule for 90° CCW rotation: $(x, y) \rightarrow (-y, x)$

- Image: $(-4, 3)$

- Rotation About a Point

- Problem: Rotate point $Q(2, 5)$ 180° about the point $R(1, 2)$.

- Solution:

- Translate Q and R so that R becomes the origin.

- $Q' = (2-1, 5-2) = (1, 3)$

- Rotate 180° : $(x, y) \rightarrow (-x, -y)$

- New point: $(-1, -3)$

- Translate back: $(-1 + 1, -3 + 2) = (0, -1)$

- Answer: $(0, -1)$

- Determine the Rotation Angle

- Problem: Given triangle ABC, if $A(1, 2)$ maps to $A'(-2, 1)$ under rotation about the origin, find the angle of rotation.

- Solution:

- Find the vector $\vec{A} = (1, 2)$ and $\vec{A'} = (-2, 1)$.

- Use the dot product to find the angle:

$\angle$

$$\cos \theta = \frac{\vec{A} \cdot \vec{A'}}{|\vec{A}| |\vec{A'}|}$$

\\

- Calculate:

\\

$$\vec{A} \cdot \vec{A'} = (1)(-2) + (2)(1) = -2 + 2 = 0$$

\\

\\

$$|\vec{A}| = \sqrt{1^2 + 2^2} = \sqrt{5}$$

\\

\\

$$|\vec{A'}| = \sqrt{(-2)^2 + 1^2} = \sqrt{4 + 1} = \sqrt{5}$$

\\

\\

$$\cos \theta = 0 / (\sqrt{5} \times \sqrt{5}) = 0$$

\\

- Thus, $\theta = 90^\circ$ or 270° . The direction indicates a 90° rotation.
