Introduction to the Arithmetic of Equations

The arithmetic of equations forms the backbone of algebra, focusing on solving for unknown variables through various operations. This section introduces the foundational concepts necessary to understand and work with algebraic equations effectively.

What Are Equations?

An equation is a mathematical statement that asserts the equality of two expressions, typically involving variables and constants. For example:

- $2x + 5 = 11$
- $y / 3 = 4$
- $3a - 7 = 2a + 3$

The primary goal in solving an equation is to find the value(s) of the variable(s) that make the statement true. These solutions are called solutions or roots of the equation.

Types of Equations

Equations can vary based on their complexity and the degree of the variables involved:

- Linear equations: Equations where the highest power of the variable is 1 (e.g., $3x + 4 = 0$).
- Quadratic equations: Equations where the highest power of the variable is 2 (e.g., $x^2 - 5x + 6 = 0$).

- Polynomial equations: Equations involving variables raised to powers higher than 2.
- Rational equations: Equations involving fractions with variables in numerators or denominators.
- Radical equations: Equations involving roots, such as square roots or cube roots.
