Introduction to RDBMS

What is RDBMS?

A Relational Database Management System (RDBMS) is a type of database management system based on the relational model introduced by E.F. Codd. It stores data in the form of tables (also called relations), which consist of rows (records) and columns (attributes). RDBMS allows users to create, read, update, and delete data efficiently while maintaining data integrity and security.

Features of RDBMS

- **Structured Data Storage:** Data is stored in tables with predefined schemas.
- **Data Integrity and Accuracy:** Constraints and rules ensure data consistency.
- **Support for SQL:** Standardized language for querying and managing data.
- **Transaction Support:** Ensures data reliability through ACID properties.
- **Concurrency Control:** Multiple users can access and modify data simultaneously without conflicts.
- **Data Security:** Authentication, authorization, and encryption mechanisms.

Core Components of RDBMS

1. Tables (Relations)

Tables are the primary data storage units. Each table consists of:

- Columns: Define data types and attributes.
- Rows: Actual data entries.

2. Keys

Keys are crucial for establishing relationships and ensuring data integrity.

- **Primary Key:** Unique identifier for each row in a table.
- **Foreign Key:** A field that references the primary key of another table, establishing relationships.
- **Candidate Keys:** Possible alternatives to primary keys.

3. Indexes

Indexes improve data retrieval speed by providing quick access to rows based on key values.

4. Views

Virtual tables created by querying one or more tables; used for simplifying complex queries and enhancing security.

5. Schemas

Define the logical structure of data, including tables, views, indexes, and relationships.

Types of RDBMS

Understanding different types of RDBMS helps in selecting the right database system for specific requirements.

- **Commercial RDBMS:** Oracle, Microsoft SQL Server, IBM Db2
- **Open-source RDBMS:** MySQL, PostgreSQL, MariaDB
- **Embedded RDBMS:** SQLite, HyperSQL

- **Third Normal Form (3NF):** Eliminates transitive dependencies.
- **Boyce-Codd Normal Form (BCNF):** Handles certain types of anomalies beyond 3NF.

Relationships in RDBMS

Relationships define how tables relate to each other.

- **One-to-One:** Each row in Table A relates to one row in Table B.
- **One-to-Many:** One row in Table A relates to multiple rows in Table B.
- **Many-to-Many:** Multiple rows in Table A relate to multiple rows in Table B, often managed via junction tables.
