Question 1: How do you prepare a blood smear for microscopy?

Answer:

- Obtain a capillary or venous blood sample using a sterile lancet or needle.
- Place a small drop of blood near one end of a clean glass slide.
- Use a second slide (spreader slide) held at a 30-45 degree angle to the first slide.
- Push the spreader slide forward smoothly to spread the blood across the slide, creating a thin, feathered edge.
- Allow the smear to air dry, then fix with methanol if necessary before staining.

Question 2: What are the common causes of hemolysis in blood samples?

Answer:

Common causes include:

- Using a needle that's too small or excessive force during venipuncture.
- Vigorous shaking of the sample.
- Prolonged tourniquet application causing stasis.
- Improper collection techniques leading to cell rupture.
- Using expired or contaminated reagents.

Implication: Hemolysis can interfere with test results, especially affecting analytes like potassium and enzymes.

Question 3: How is the accuracy of the laboratory test validated?

Answer:

Accuracy is validated through:

- Running quality control (QC) samples with known values alongside patient samples.
- Ensuring instrument calibration before testing.
- Performing duplicate tests to confirm reproducibility.
- Reviewing control results to verify they fall within established control ranges.
