Sample Chemistry Question

Question:

Calculate the molar mass of calcium carbonate (CaCO_3) and determine the mass of CaCO_3 needed to react with 50 grams of hydrochloric acid (HCl), assuming a complete reaction.

Solution Overview (based on memorandum):

- Molar mass of CaCO_3 = 40 (Ca) + 12 (C) + 3×16 (O) = 100 g/mol.
- Reaction: $\text{CaCO}_3 + 2\text{HCl} \rightarrow \text{CaCl}_2 + \text{H}_2\text{O} + \text{CO}_2$.

- Moles of HCl in 50 g = $50 / 36.46 \approx 1.37$ mol.
- From the balanced equation, 1 mol of CaCO_3 reacts with 2 mol of HCl, so:

Moles of CaCO_3 needed = $1.37 / 2 \approx 0.685$ mol.

- Mass of CaCO_3 = $0.685 \times 100 = 68.5$ g.

Key Takeaway:

The memorandum emphasizes the importance of understanding molar ratios and unit conversions for solving stoichiometry questions.

Sample Physics Question

Question:

A 10 kg object is lifted to a height of 5 meters. Calculate the work done against gravity and the gravitational potential energy gained by the object.

Solution Overview (based on memorandum):

- Work done $W = mgh$, where $g = 9.8 \text{ m/s}^2$.
- $W = 10 \times 9.8 \times 5 = 490$ Joules.
- The gravitational potential energy (PE) gained = $W = 490$ Joules.
