Sample Question 1: Coronary Artery Disease

Question: A 55-year-old man presents with chest pain on exertion. Coronary angiography reveals significant stenosis in the left anterior descending artery. Which of the following best explains the pathophysiology?

Answer Explanation: The stenosis causes decreased blood flow during increased myocardial demand, leading to ischemia. The answer details the process of atherosclerotic plaque formation, luminal narrowing, and resultant oxygen supply-demand mismatch.

Study Tip: Focus on understanding how arterial narrowing correlates with ischemic symptoms, and review the pathogenesis of atherosclerosis.

Sample Question 2: Heart Failure

Question: A patient with longstanding hypertension develops dyspnea and peripheral edema. Echocardiogram shows a reduced ejection fraction. What is the primary mechanism?

Answer Explanation: Chronic hypertension leads to increased afterload, resulting in left ventricular hypertrophy and eventually systolic dysfunction. The answer discusses how pressure overload causes remodeling and impairs contractility.

Study Tip: Connect clinical features with underlying physiology, reinforcing the importance of hypertension management in preventing heart failure.
