- a) PROC SQL
- b) DATA step assignment
- c) PROC MEANS
- d) PROC FORMAT

- **Answer:** b) DATA step assignment

- **Explanation:** In a DATA step, you can create new variables directly by assigning expressions, e.g., ``new_var = var1 + var2;``.

Macro Programming

- **Question:** Which macro statement is used to conditionally execute code based on a macro variable value?

- a) %IF
- b) %DO
- c) %ELSE
- d) %END

- **Explanation:** The ``%IF`` statement allows conditional execution within macro code, enabling dynamic macro logic based on macro variable values.

SQL Processing within SAS

- **Question:** When using PROC SQL to join two tables, which type of join returns all rows from the first table and the matched rows from the second table?

- a) INNER JOIN
- b) LEFT JOIN
- c) RIGHT JOIN
- d) FULL OUTER JOIN

- **Answer:** b) LEFT JOIN

- **Explanation:** A LEFT JOIN returns all records from the first table (left table) and matched records from the second table. If there is no match, NULLs are returned for the columns from the second table.

Performance Optimization

- **Question:** Which SAS option can improve the performance of large data processing jobs?

- a) OBS=
- b) SORTSIZE=
- c) OPTIONS NOFMterr

The exam assesses knowledge in areas such as macro programming, data manipulation, SQL processing, and debugging.

Understanding the Exam Format and Question Types

Before diving into sample questions, it's vital to understand the structure of the exam:

Question Types

- **Multiple Choice:** Select the best answer from four or more options.
- **Code Interpretation:** Analyze a given SAS code snippet and determine its output or identify errors.
- **Code Completion:** Fill in missing parts of SAS code to achieve a specified result.
- **Scenario-based Questions:** Apply knowledge to real-world situations involving data steps, macros, or SQL procedures.

Time Management Tips

- Allocate time proportionally to question difficulty.
- Mark challenging questions and revisit if time permits.
- Practice with sample exams to improve speed and accuracy.

Key Topics Covered in the SAS Advanced Certification Exam

The exam encompasses several advanced topics, which are crucial to understand thoroughly. Below are core areas with sample questions to guide your preparation.

1. Macro Programming and Automation

Macro programming is a cornerstone of advanced SAS skills. Questions often test knowledge of macro language syntax, macro variables, macro functions, and macro debugging.

Sample Macro Question

Given the macro code below:

```
``sas

%macro generate_data(start=, end=);

%do i=&start. %to &end.;

data data&i.;

x = &i.;

run;

%end;

%mend generate_data;

%generate_data(start=1, end=5);

...

```

What is the number of datasets created, and what are their names?

- Five datasets named DATA1 through DATA5.
- Six datasets, including DATA0 through DATA5.
- Only one dataset named DATA.
- Data sets are not created due to macro errors.

Answer: Option 1. The macro creates five datasets: DATA1, DATA2, DATA3, DATA4, and DATA5.

2. Data Step Processing and Data Management

Advanced data manipulation involves understanding how data steps operate, including the use of retain statements, conditional processing, and efficient data handling.

Sample Data Step Question

Consider the following SAS code:

```
``sas  
  
data result;  
  
set original;  
  
retain total 0;  
  
if first.id then total = 0;  
  
total + value;  
  
if last.id;  
  
run;  
  
``
```

What is the purpose of this code?

- Calculates the sum of 'value' for each 'id' group.

- Creates a running total of all 'value' observations.
- Filters data to only include the first and last observations.
- Deletes duplicate observations based on 'id'.

Answer: Option 1. It calculates the sum of 'value' for each 'id' group.

3. SQL Processing in SAS

Proficiency in PROC SQL is vital for advanced SAS programmers, especially for complex joins, subqueries, and data manipulation.

Sample PROC SQL Question

Given two tables, EMPLOYEES and DEPARTMENTS, with keys EmployeeID and DepartmentID respectively, which of the following SQL statements correctly retrieves employee names along with their department names?

```
```\nsas\n\nproc sql;\n\nselect e.Name, d.DepartmentName\n\nfrom employees e\n\ninner join departments d\n\non e.DepartmentID = d.DepartmentID;\n\nquit;\n\n```\n
```

What type of join is used in the above query?

- Inner join
- Left join
- Right join
- Full outer join

Answer: Option 1. It uses an inner join.

## 4. Advanced Data Analysis and Statistical Procedures

While not the primary focus, understanding how to invoke advanced procedures like PROC MIXED, PROC GLM, or PROC SURVEYREG can be tested.

### Sample Procedure Question

Which PROC procedure is most appropriate for fitting a mixed model with random effects?

- PROC GLM
- PROC MIXED
- PROC REG
- PROC ANOVA

Answer: Option 2. PROC MIXED.

## 5. Debugging and Performance Optimization

Efficiency and error handling are key components. Questions may involve interpreting log messages or optimizing code.

### Sample Debugging Question

In the following code, an error occurs:

```
````sas
```

```
data test;
```

```
set dataset;
```

```
if age > 30 then status = 'Adult';
```

```
else status = 'Minor';
```

```
run;
```

```
````
```

The variable 'status' is character, but the code produces an error. What is the likely cause?

- Missing quotes around the string literals
- Variable 'status' is numeric
- Dataset 'dataset' does not exist
- Missing semicolon at the end of the data step

Answer: Option 1. String literals should be enclosed in quotes, e.g., `Adult` and `Minor`.

## Strategies for Effective Preparation

To excel in the SAS advanced certification exam, candidates should adopt targeted strategies:

### Hands-On Practice

- Regularly write and debug macro code.
- Manipulate datasets with complex data steps.
- Practice SQL joins and subqueries.

Below are additional questions to test your readiness:

- Explain the difference between macro variables and macro parameters.
- Describe how to optimize a SAS program that processes large datasets.
- Write a macro that dynamically generates code based on user input.
- Interpret the following log message and suggest possible fixes.

Sample Log Message:

\*\*\*

ERROR: Variable STATUS is uninitialized.

\*\*\*

Interpretation: The variable 'STATUS' was used before being assigned a value. To fix this, initialize 'STATUS' before usage.

## Conclusion

Preparing for the SAS advanced certification exam can be challenging, but with a solid understanding of core topics, familiarization with question types, and consistent practice using sample questions, candidates can significantly improve their chances of success. Focus on macro programming, data management, SQL processing, and debugging, as these are frequently tested areas. ## Sample Questions for SAS Advanced Certification

Below, we analyze representative sample questions that embody the types of problems candidates can expect.

### 1. Data Manipulation and Transformation

Question:

You are given a dataset `sales\_data` with variables `product\_id`, `sales\_date`, `quantity\_sold`, and `price`. Write a DATA step to create a new dataset that contains the total sales amount (`total\_sales`) for each `product\_id` across all dates.

Options:

A)

```
```sas
```

```
data total_sales;
```

```
set sales_data;
```

```
by product_id;
```

```
total_sales + (quantity_sold price);
```

```
run;
```

```
```
```

B)

```
```sas
```

```
proc sql;  
  
create table total_sales as  
  
select product_id, sum(quantity_sold price) as total_sales  
  
from sales_data  
  
group by product_id;  
  
quit;
```

```
---
```

C)

```
```sas
```

```
proc means data=sales_data sum;
```

```
var quantity_sold price;
```

```
class product_id;
```

```
run;
```

```

```

D)

```
```sas
```

```
data total_sales;
```

```
set sales_data;
```

```
total_sales = sum(total_sales, quantity_sold price);
```

```
run;
```

```
---
```

Correct Answer: B

Discussion:

Option B correctly uses PROC SQL with a GROUP BY clause to aggregate total sales per product. Option A is incorrect because the `+` operator with `by` requires a RETAIN statement and proper initialization, making it less straightforward. Option C is invalid because `proc means` cannot directly sum the product of two variables. Option D is incomplete and lacks initialization.

2. Macro Programming and Automation

Question:

You need to automate report generation for multiple datasets named `region1`, `region2`, ..., `region10`. Which macro code snippet correctly loops through these datasets and prints their contents?

Options:

A)

```
``sas
```

```
%macro print_regions;
```

```
%do i=1 %to 10;
```

```
proc print data=region&i.;
```

```
title "Region &i. Data";
```

```
run;
```

```
%end;
```

```
%mend;
```

```
%print_regions;
```

```
...
```

B)

```
``sas
```

```
%macro print_regions;
```

```
%do i=1 %to 10;
```

```
proc print data=region&i;
```

```
title "Region &i Data";
```

```
run;
```

```
%end;
```

```
%mend;
```

```
%print_regions;
```

```
``
```

C)

```
``sas
```

```
%macro print_regions;
```

```
%do i=1 %to 10;
```

```
proc print data=region&i.;
```

```
title "Region &i Data";
```

```
run;
```

```
%end;
```

```
%mend;
```

```
%print_regions;
```

...

D)

```
```sas
```

```
%macro print_regions;
```

```
%do i=1 %to 10;
```

```
proc print data=region&i.;
```

```
title "Region &i Data";
```

```
run;
```

```
%end;
```

```
%mend;
```

```
%print_regions;
```

...

Correct Answer: C

Discussion:

Multiple options are similar, but the key is the correct macro variable referencing. The correct syntax uses `region&i.` in the `data=` statement. The macro correctly loops from 1 to 10, generating the dataset names dynamically.

### 3. Statistical Procedures and Model Building

Question:

In a logistic regression model using PROC LOGISTIC, which statement provides the odds ratio estimates for each predictor?

Options:

A)

```
``sas
```

```
model outcome(event='1') = age income education;
```

```
run;
```

```
```
```

B)

```
``sas
```

```
oddsratio outcome;
```

```
run;
```

```
```
```

C)

```
``sas
```

```
proc logistic data=dataset;
```

```
model outcome(event='1') = age income education;
```

```
oddsratio age / cl=both;
```

```
oddsratio income / cl=both;
```

```
oddsratio education / cl=both;
```

```
run;
```

```
```
```

D)

```
``sas
```

```
proc logistic data=dataset;  
  
model outcome(event='1') = age income education;  
  
estimate 'Odds Ratios' / exp;  
  
run;  
  
***
```

Correct Answer: C

Discussion:

Option C explicitly requests odds ratios with confidence limits for each predictor. The ``oddsratio`` statement is used for this purpose. Option A specifies the model but does not request odds ratios. Option B is invalid SAS syntax. Option D uses ``estimate`` statements, which are more for specific parameter estimates.
