 - A phosphate group
- **Double Helix:** Two strands of nucleotides are held together by hydrogen bonds between complementary bases:
 - Adenine pairs with thymine (A-T)
 - Guanine pairs with cytosine (G-C)

Functions of DNA

- Stores genetic information necessary for organism development and function
- Replicates during cell division to pass genetic material to daughter cells

Transcription is the process where a segment of DNA is copied into RNA by the enzyme RNA polymerase. This process involves:

- Unwinding the DNA double helix at the gene of interest
- Assembling complementary RNA nucleotides based on the DNA template strand
- Producing a primary RNA transcript (pre-mRNA in eukaryotes), which may undergo processing before becoming mature mRNA

Proteins: The Functional Molecules

What are Proteins?

Proteins are large, complex molecules composed of amino acids. They perform a vast array of functions within organisms, including enzymatic activity, structural support, signaling, transport, and immune responses.
