Fundamental Concepts in Writing Equations of Lines

What Is a Linear Equation?

A linear equation is an algebraic expression that models a straight line on a coordinate plane. The general form of a linear equation in two variables (x and y) is:

``plaintext

$$y = mx + b$$

```

Where:

- m is the slope of the line, indicating its steepness and direction.
- b is the y-intercept, the point where the line crosses the y-axis.

Understanding the roles of m and b is crucial for writing and interpreting equations.

## Key Components of a Line

- Slope (m): Measures the rate of change of y with respect to x.
- Y-intercept (b): The point where the line intersects the y-axis.
- Points on the line: Coordinates (x, y) that satisfy the line's equation.

## Steps to Write Equations of Lines (Investigation 2)

Writing the equation of a line involves several key steps, often starting with known data such as two points or a point and a slope.

### 1. Using Two Points

When you have two points,  $(x_1, y_1)$  and  $(x_2, y_2)$ , follow these steps:

- Calculate the slope (m):

\[

$$m = \frac{y_2 - y_1}{x_2 - x_1}$$

\]

- Write the point-slope form:

\[

$$y - y_1 = m(x - x_1)$$

\]

- Convert to slope-intercept form (if needed):

Solve for y to get:

\[

$$y = m(x - x_1) + y_1$$

\]

- Simplify to slope-intercept form:

Expand and simplify to get  $y = mx + b$ .

Example:

Given points (2, 3) and (4, 7):

- Calculate slope:

\[

$$m = \frac{7 - 3}{4 - 2} = \frac{4}{2} = 2$$

\]

- Use point-slope form with point (2, 3):

\[

$$y - 3 = 2(x - 2)$$

\]

- Simplify:

\[

$$y - 3 = 2x - 4$$

\]

- Final equation:

\[

$$y = 2x - 1$$

\]

## 2. Using a Point and a Slope

If you know a point (x?, y?) and the slope m:

- Start with the point-slope form:

\[

$$y - y_1 = m(x - x_1)$$

\]

- Simplify to slope-intercept form:

Expand and solve for y.

Example:

Point (3, 4), slope m = 5:

\[

$$y - 4 = 5(x - 3)$$

\]

\[

$$y - 4 = 5x - 15$$

\]

$\backslash$ 

$$y = 5x - 11$$

 $\backslash$ 

## Special Cases and Additional Techniques

### Vertical and Horizontal Lines

- Vertical lines: Have an undefined slope. The equation is of the form:

 $\backslash$ 

$$x = a$$

 $\backslash$ 

where  $a$  is the  $x$ -coordinate of the line.

- Horizontal lines: Have a slope of zero. The equation is:

 $\backslash$ 

$$y = b$$

 $\backslash$ 

where  $b$  is the  $y$ -coordinate of the line.

### Using the Slope-Intercept Form Directly

Sometimes, you may be given the slope and  $y$ -intercept directly. The process is straightforward:

- Write the equation as:

 $\backslash$

$$y = mx + b$$

\]

- Plug in the known slope and intercept.

Example:

Given  $m = -3$  and  $b = 5$ :

\[

$$y = -3x + 5$$

\]

**Question** What is the main goal of the 'Writing Equations of Lines' Investigation 2? The main goal is to understand how to write the equations of lines given different types of information, such as points and slopes, and to explore the relationships between the equations and their graphs. **Answer** How do you find the slope of a line using two points in Investigation 2? You find the slope by subtracting the y-coordinates and dividing by the difference in the x-coordinates:  $m = (y_2 - y_1) / (x_2 - x_1)$ . What is the significance of the slope-intercept form  $y = mx + b$  in writing equations of lines? The slope-intercept form clearly shows the slope ( $m$ ) of the line and the y-intercept ( $b$ ), making it easy to graph the line and understand its rate of change. How can you determine the equation of a line if

you are given a point and the slope? Use the point-slope form:  $y - y_1 = m(x - x_1)$ , where  $(x_1, y_1)$  is the given point and  $m$  is the slope. Then, you can rearrange to slope-intercept form if needed. What strategies are effective for solving problems involving parallel and perpendicular lines in Investigation 2? Identify the slopes of the given lines; parallel lines have equal slopes, while perpendicular lines have slopes that are negative reciprocals. Use this information to write equations accordingly. Why is it important to verify your equation matches the given line in the investigation? Verifying ensures that the equation accurately represents the line, helping to confirm your understanding and avoid errors when graphing or solving related problems. What common mistakes should students avoid when writing equations of lines in this investigation? Students should avoid incorrect calculation of slopes, mixing up point-slope and slope-intercept forms, and forgetting to check if the equation correctly reflects the given points or conditions.
