- Environmental Loads: Wind, temperature effects, seismic forces, and snow loads.
- Special Loads: Impact factors, construction loads, and accidental loads.

Each load type has associated safety factors, reflecting their variability and the consequences of failure.

Load Combinations

Design engineers must consider multiple scenarios, combining different loads with specific factors. For example:

- Serviceability Limit State (SLS): Ensures comfort and functionality, with less conservative load factors.
- Ultimate Limit State (ULS): Ensures safety against failure, employing higher load factors.

Common load combinations include:

- $1.25(DL) + 1.75(LL)$
- $1.25(DL) + 1.5(\text{Environmental loads})$
- $1.0(DL) + 1.0(LL) + 1.0(\text{Environmental})$, etc.

These combinations enable a comprehensive assessment of the bridge's performance under various conditions.

Resistance Factors (?)

Resistance factors are applied to nominal strengths to account for uncertainties:

- For concrete, ϕ typically ranges from 0.65 to 0.75.
- For steel, ϕ often ranges from 0.75 to 0.85.
- For composite systems, specific factors are established based on material behavior.

The precise values are derived from safety research and calibration studies, ensuring a high probability of safety without unnecessary overdesign.
