Sample Plus One Zoology Questions with Answers

Q1. Differentiate between the exoskeleton and endoskeleton with examples.

Answer: The exoskeleton is an external skeleton that provides support and protection to the body of an animal. It is found in insects, crustaceans, and arachnids. The endoskeleton, on the other hand, is an internal skeleton found in vertebrates like humans, fishes, and birds. It provides structural support and facilitates movement.

Q2. Name four phyla of invertebrates and give one example of each.

Answer:

- Porifera (sponges)
- Cnidaria (jellyfish)
- Platyhelminthes (flatworms)
- Arthropoda (insects)

Q3. Describe the process of respiration in insects.

Insects respire through a network of internal tubes called tracheae that open to the outside via small pores called spiracles. Air enters these spiracles, diffuses through the tracheae, and reaches the tissues directly, facilitating efficient gas exchange without the involvement of a circulatory system.

Q4. Explain the significance of the notochord in chordates.

The notochord is a flexible, rod-shaped structure that provides support during embryonic development. In some chordates like vertebrates, it is replaced by the vertebral column in adults. It serves as an attachment point for muscles and aids in locomotion.
