Example Problems and Solutions

Example 1: Two-Variable Word Problem

Problem:

Gina Wilson 2012 algebra problem: A store sells pencils and erasers. The total cost for 3 pencils and 2 erasers is \$5.50. If each pencil costs \$0.50, what is the cost of each eraser?

Solution:

Step 1: Define variables:

Let x = cost of one eraser.

Step 2: Write the equation based on the problem:

Cost for 3 pencils = $3 \times \$0.50 = \1.50

Total cost: $1.50 + 2x = 5.50$

Step 3: Set up the equation:

$$3(0.50) + 2x = 5.50$$

$$0.50(3) + 2x = 5.50$$

Step 4: Simplify and solve for x :

$$1.50 + 2x = 5.50$$

$$2x = 5.50 - 1.50$$

$$2x = 4.00$$

$$x = 4.00 / 2$$

$$x = 2.00$$

Answer: Each eraser costs \$2.00.

Example 2: System of Equations Word Problem

Problem:

Gina Wilson 2012 algebra problem: A train travels from city A to city B at 60 mph. The same train travels from city B to city A at 40 mph. If the distance between the two cities is 180 miles, how long does each trip take?

Solution:

Step 1: Define variables:

Let t = time (in hours) for the trip from city A to B.

Step 2: Set up equations:

Time from A to B: t

$$\text{Distance} = \text{speed} \times \text{time} = 60 \times t$$

Similarly, for B to A, the time is $(180 / 40) = 4.5$ hours, but since the problem asks for the time based on the variable, we can verify the total distance:

$$\text{Total distance: } 60t + 40t = 180$$

Step 3: Write the equation:

$$60t + 40t = 180$$

Step 4: Simplify and solve:

$$100t = 180$$

$$t = 180 / 100$$

$$t = 1.8 \text{ hours}$$

Step 5: Find time in hours for each trip:

- From city A to B: 1.8 hours
- From city B to A: $180 / 40 = 4.5$ hours

Answer: The trip from city A to B takes approximately 1.8 hours, and the return trip takes 4.5 hours.

Scenarios requiring simultaneous equations solutions, such as mixture problems or motion.

- Quadratic Word Problems

Situations involving parabolic relationships like projectile motion or area optimization.

- Application and Word Problem Mix

Problems integrating multiple algebraic concepts to simulate real-world decision-making.

Deep Dive into Typical Word Problem Examples

Linear Equations and Inequalities

Example:

A family is planning a road trip. They have a budget of \$500 for gas and lodging. If the cost of gas is \$3 per gallon and lodging costs \$100 per night, how many nights can they stay if they plan to spend exactly \$500?

Analysis:

- Let g be gallons of gas, and n be the number of nights.
- The total cost: $(3g + 100n = 500)$.
- Additional constraints or inequalities might be added to reflect realistic limits.

Educational Value:

These problems promote understanding of linear relationships, substitution, and equality solving, while grounding algebra in relatable contexts.

Systems of Equations

Example:

A local gym offers two membership plans: a monthly plan costing \$30 per month, and a yearly plan costing \$300 upfront. If a customer chooses to pay for 6 months and spends the same amount as the monthly plan, what is the number of months needed to break even with the yearly plan?

Analysis:

- Set up equations: $(30 \times 6 = 300)$ (monthly plan total cost).
- Students analyze when paying monthly becomes cost-effective compared to a lump-sum annual payment.

Educational Value:

These problems develop skills in solving systems of equations, comparing options, and understanding cost-benefit scenarios.

Quadratic Word Problems

Example:

A ball is thrown upward with an initial velocity of 20 meters per second. Its height $h(t)$ in meters after t seconds is modeled by $h(t) = -4.9t^2 + 20t$. When will the ball reach a height of 15 meters?

Analysis:

- Set $h(t) = 15$: $-4.9t^2 + 20t = 15$.
- Rearranged as a quadratic: $-4.9t^2 + 20t - 15 = 0$.
- Students solve using quadratic formula, factoring, or completing the square.

Educational Value:

These problems foster understanding of quadratic functions, vertex form, and real-world physics applications.

Whether you're a student aiming to grasp key concepts or a parent/teacher seeking effective teaching strategies, understanding the core elements of Lesson 9 is essential for success.

Overview of Saxon Algebra 1/2 Lesson 9

This lesson continues to develop students' algebra proficiency by introducing new problem types and reinforcing previous lessons. The primary objectives include mastering the solving of linear equations, understanding the structure of algebraic expressions, and applying these skills to real-world problems.

Key Topics Covered:

- Solving multi-step linear equations
- Simplifying algebraic expressions
- Applying substitution methods
- Word problems involving algebraic concepts
- Review of basic properties of equality and inequality

This lesson is structured to gradually increase in complexity, allowing learners to build confidence and competence in algebra.

Core Concepts in Saxon Algebra 1/2 Lesson 9

1. Solving Multi-Step Linear Equations

One of the main focuses of Lesson 9 is on solving equations that require multiple steps. These problems often involve combining like terms, distributing, and performing inverse operations.

Important strategies include:

- Isolating the variable term on one side of the equation.
- Using addition or subtraction to eliminate constants.
- Applying multiplication or division to solve for the variable.
- Checking solutions by substituting back into the original equation.

Example problem:

Solve for x : $3x + 5 = 2x + 9$

Solution steps:

- Subtract $2x$ from both sides: $3x - 2x + 5 = 9$? $x + 5 = 9$
- Subtract 5 from both sides: $x = 4$
- Verify: $3(4) + 5 = 2(4) + 9$? $12 + 5 = 8 + 9$? $17 = 17$?

2. Simplifying Algebraic Expressions

Students learn to combine like terms and use the distributive property to simplify complex expressions.

Key points:

- Recognize like terms: terms with the same variable raised to the same power.
- Use distributive property: $a(b + c) = ab + ac$.
- Combine terms carefully to reduce expressions to simplest form.

Example:

Simplify $4x + 3 + 2x - 7$

Solution:

- Combine like terms: $(4x + 2x) + (3 - 7)$
- Result: $6x - 4$

3. Applying Substitution Method

This method involves replacing a variable with a known value to evaluate or solve an expression or equation.

Steps:

- Find the value of the variable.
- Substitute the value into the expression.
- Simplify to find the result.

Example:

Given $y = 2x + 1$, find y when $x = 3$.

Solution:

- Substitute: $y = 2(3) + 1$
- Simplify: $y = 6 + 1 = 7$

4. Word Problems and Real-World Applications

Applying algebra to solve practical problems is a critical component of Lesson 9.

Common types of word problems include:

- Work rate problems
- Mixture problems
- Distance, speed, and time problems
- Cost and profit calculations

Example problem:

A car rental charges a flat fee of \$50 plus \$0.20 per mile. Write an expression for the total cost C if the car is driven m miles. How much does it cost for 150 miles?

Solution:

- Expression: $C = 50 + 0.20m$
- For 150 miles: $C = 50 + 0.20 \times 150 = 50 + 30 = \80

Learning Activities and Practice Exercises

Engagement is vital in mastering algebraic concepts. Saxon Lesson 9 provides various activities to reinforce understanding.

Activities include:

- Solving a series of equations with increasing difficulty
- Simplifying complex expressions
- Word problem exercises with guided steps
- Group discussions to explain problem-solving strategies
- Online quizzes for immediate feedback

Sample Practice Exercise:

Solve for x : $5(x - 2) = 3x + 4$

Step-by-step solution:

- Distribute: $5x - 10 = 3x + 4$
- Subtract $3x$ from both sides: $2x - 10 = 4$

Sample Word Problem and Solution Using McGraw Answer Key Algebra

Problem:

Maria is purchasing notebooks and pens. Notebooks cost \$3 each, and pens cost \$1.50 each. If she spends \$15 in total, how many notebooks and pens did she buy?

Solution Steps:

- Assign variables:
 - Let (n) = number of notebooks
 - Let (p) = number of pens
- Write the equation based on total cost:
 - $(3n + 1.5p = 15)$

- Simplify the equation:

- Multiply through by 2 to clear decimals:
- $(6n + 3p = 30)$

- Express one variable:

- $(6n = 30 - 3p)$
- $(n = (30 - 3p) / 6)$
- Simplify:
- $(n = 5 - 0.5p)$

- Find integer solutions:

- Since (n) and (p) are counts, they must be whole numbers.
- (p) must be even (because $0.5p$ must be an integer).

- Test possible values:

- If $(p = 0)$:
- $(n = 5 - 0) = 5$ notebooks, 0 pens.
- If $(p = 2)$:
- $(n = 5 - 1) = 4$ notebooks, 2 pens.
- If $(p = 4)$:
- $(n = 5 - 2) = 3$ notebooks, 4 pens.
- If $(p = 6)$:
- $(n = 5 - 3) = 2$ notebooks, 6 pens.
- If $(p = 8)$:
- $(n = 5 - 4) = 1$ notebook, 8 pens.

Check total cost for each:

- $(p=2), (n=4)$:

- $(34 + 1.52 = 12 + 3 = 15)$? Valid.

- $(p=4)$, $(n=3)$:

- $(33 + 1.54 = 9 + 6 = 15)$? Valid.

- $(p=6)$, $(n=2)$:

- $(32 + 1.56 = 6 + 9 = 15)$? Valid.

- Conclusion:

- Maria could have bought:

- 4 notebooks and 2 pens, or

- 3 notebooks and 4 pens, or

- 2 notebooks and 6 pens.

- Use the McGraw answer key to verify these solutions and explore alternative approaches.

Using Diagrams and Visual Aids

- Draw diagrams, charts, or graphs to visualize relationships.
- Especially helpful for problems involving geometry, distances, or rates.

Creating Equations Step-by-Step

- Break complex problems into smaller parts.
- Write multiple equations if needed to represent different relationships.

Working Backward

- Start from the desired outcome.
- Determine what previous steps lead to that result.

Guess and Check

- Make an educated guess.
- Refine based on whether it satisfies the conditions.

Using Logical Reasoning

- Eliminate impossible options.
- Use logical deduction to narrow solutions.

Common Types of Word Problems and How to Approach Them

Understanding the typical categories helps in developing specific strategies.

1. Age Problems

- Use current ages and age differences.
- Set age variables and translate relationships (e.g., "John is twice as old as Mary").

2. Distance, Rate, Time Problems

- Recall the formula: $\text{Distance} = \text{Rate} \times \text{Time}$.
- Set up equations based on combined or separate journeys.

3. Mixture and Concentration Problems

- Use algebra to model proportions and concentrations.
- Set variables for quantities of different components.

4. Profit, Loss, and Revenue Problems

- Translate profit or loss percentages into equations.
- Base calculations on cost price or selling price.

5. Work and Rate Problems

- Determine combined and individual work rates.
- Use the formula: $\text{Work} = \text{Rate} \times \text{Time}$.

Features, Pros, and Cons of Different Approaches

Understanding the strengths and limitations of various methods can help choose the most effective strategy.

Diagrammatic Approach

- Features: Visual, intuitive, clarifies relationships.
- Pros: Enhances understanding; useful for geometric problems.
- Cons: May be less effective with abstract algebraic relationships.

Algebraic Setup

- Features: Precise, systematic.
- Pros: Facilitates solving complex problems; scalable.
- Cons: Can be intimidating for beginners; prone to algebraic errors.

Guess and Check

- Features: Trial-based, straightforward.
- Pros: Useful when equations are difficult to set up.
- Cons: Inefficient for large or complex solutions; not rigorous.

Logical Reasoning/Backwards Approach

- Features: Deductive, strategic.
- Pros: Reduces trial-and-error; builds understanding.
- Cons: Requires strong reasoning skills; may be time-consuming.

Enhancing problem-solving proficiency involves practice and strategic learning.

- Practice Regularly: Exposure to various problem types improves adaptability.
- Learn to Translate Language: Familiarize with common phrases and their algebraic equivalents.
- Check Your Work: Always verify solutions by substituting back into the original problem.
- Break Down Complex Problems: Divide problems into smaller, manageable parts.
- Learn from Mistakes: Analyze errors to understand misconceptions.
- Use Resources: Leverage textbooks, online tutorials, and math games.

Common Pitfalls and How to Avoid Them

Recognizing and avoiding typical errors can save time and frustration.

- Misreading the Problem: Read carefully; highlight key info.
- Incorrect Variable Assignments: Clearly define variables upfront.
- Wrong Translation: Practice translating sentences into equations accurately.
- Skipping Steps: Show all work to prevent errors.
- Ignoring Units: Keep track of units and conversions.
- Overlooking Constraints: Consider all conditions in the problem.
