Understanding Fractional Order Systems

What Are Fractional Order Systems?

Fractional order systems are systems characterized by differential equations involving derivatives and integrals of fractional (non-integer) order. Unlike traditional systems described by integer-order derivatives, fractional systems exhibit properties such as memory and hereditary effects, which are closer to real-world behaviors.

For example, a typical fractional differential equation might look like:

$\{$

$$D^{\alpha} y(t) + a_1 D^{\beta} y(t) + a_0 y(t) = u(t)$$

$\}$

where $\{ D^{\alpha} \}$ and $\{ D^{\beta} \}$ are fractional derivatives of orders $\{ \alpha \}$ and $\{ \beta \}$, respectively.

Applications of Fractional Order Systems

Fractional systems are widely used in various fields:

- **Control Theory:** Designing controllers with fractional order PID (FOPID) for improved robustness and flexibility
- **Signal Processing:** Modeling anomalous diffusion and memory effects in signals
- **Material Science:** Analyzing viscoelastic materials with fractional constitutive relations
- **Biology and Medicine:** Modeling biological tissues and pharmacokinetics

Mathematical Foundations for MATLAB Implementation

Fractional Derivatives and Integrals

Several definitions exist for fractional derivatives, with the most common being:

- Riemann-Liouville
- Caputo
- Grünwald-Letnikov

In MATLAB, the Grünwald-Letnikov approximation is popular for numerical simulation due to its straightforward implementation.

Numerical Approximations

The Grünwald-Letnikov approximation expresses the fractional derivative as:

$$\frac{d^\alpha y(t)}{dt^\alpha} \approx \frac{1}{h^\alpha} \sum_{k=0}^N (-1)^k \binom{\alpha}{k} y(t - k h)$$

where:

- h is the time step
- N is the number of past points
- $\binom{\alpha}{k}$ is the generalized binomial coefficient

This approximation lends itself well to recursive MATLAB implementations.

Implementing Fractional Order Systems in MATLAB

Basic MATLAB Functions for Fractional Calculus

To simulate fractional systems, you need:

- A method to compute fractional derivatives
- A solver for differential equations involving fractional derivatives
- Tools to analyze system responses (e.g., step, impulse)

Several MATLAB toolboxes and functions facilitate these tasks:

- FOMCON Toolbox: A comprehensive toolbox for fractional order modeling and control
- CRONE Toolbox: For fractional control systems
- Custom scripts: Implementing Grünwald-Letnikov or other methods

Below, we will focus on implementing a simple fractional derivative via Grünwald-Letnikov approximation.

Sample MATLAB Code for Grünwald-Letnikov Derivative

```
```matlab
```

```
function D_alpha_y = fracDeriv_GL(y, alpha, h)
```

```
% fracDeriv_GL computes the fractional derivative of y using Grünwald-Letnikov method.
```

```
% Inputs:
```

```
% y - signal vector (discrete samples)
```

```
% alpha - fractional order (e.g., 0.5 for half derivative)
```

```
% h - sampling interval
```

```
N = length(y);
```

```
D_alpha_y = zeros(size(y));
```

```
% Precompute binomial coefficients

cb = gamma(alpha + 1) ./ (gamma(1 + (0:N-1)) . gamma(1 - alpha + (0:N-1)));

for n = 1:N

sum_val = 0;

for k = 0:n-1

sum_val = sum_val + cb(k+1) y(n - k);

end

D_alpha_y(n) = (1 / h^alpha) sum_val;

end

end

...

```

This function computes the fractional derivative for a discrete signal. To apply it to a differential equation, further integration with system dynamics is necessary.

## Simulating a Fractional-Order Transfer Function

Fractional order transfer functions can be represented in MATLAB using the `tf` or `zpk` objects with fractional exponents. For example:

```
```matlab

% Define fractional transfer function:  $G(s) = 1 / (s^{0.5} + 1)$ 

s = tf('s');

G = 1 / (s^0.5 + 1);

% Plot step response

step(G);

```

```
title('Step Response of Fractional Order System');
```

```
```
```

Note: MATLAB's Control System Toolbox doesn't natively support fractional powers of  $s$ . To simulate such systems, approximate methods like Oustaloup's recursive filter are used.

## Oustaloup's Recursive Approximation

This method approximates  $(s^\alpha)$  with a rational function, enabling simulation with standard tools.

```
```matlab
```

```
function [num, den] = oustaloupApprox(alpha, wb, we, N)
```

```
% Returns numerator and denominator of Oustaloup approximation
```

```
% alpha - fractional order
```

```
% wb, we - frequency band
```

```
% N - order of approximation
```

```
[num, den] = oustaloup(alpha, N, wb, we);
```

```
end
```

```
```
```

Use this approximation to convert fractional transfer functions into rational functions suitable for MATLAB simulation.

## Design and Control of Fractional Order Systems

### Fractional PID Controllers (FOPID)

FOPID controllers extend classical PID controllers by incorporating fractional integrals and derivatives, offering finer tuning and robustness.

The transfer function is:

$$C(s) = K_p + \frac{K_i}{s^\lambda} + K_d s^\mu$$

$$C(s) = K_p + \frac{K_i}{s^\lambda} + K_d s^\mu$$

where:

-  $\lambda$  and  $\mu$  are fractional orders

## Implementing FOPID in MATLAB

Using the Oustaloup approximation, the fractional operators can be approximated, and the FOPID can be implemented as a standard transfer function.

```

% Example of fractional operator approximation

[Ki_num, Ki_den] = oustaloupApprox(lambda, wb, we, N);

[Kd_num, Kd_den] = oustaloupApprox(mu, wb, we, N);

% Construct FOPID controller

Kp = 1; % proportional gain

C = Kp + tf(Ki_num, Ki_den) + tf(Kd_num, Kd_den);

```

## Practical Tips for MATLAB Implementation

- **Choose the right approximation:** For fractional derivatives, Grünwald-Letnikov is simple but computationally intensive; Oustaloup is more efficient for frequency domain simulation.
- **Ensure numerical stability:** Use appropriate sampling rates and approximation orders.
- **Leverage existing toolboxes:** FOMCON, CRONE, and others provide ready-to-use functions and models.
- **Validate your models:** Compare simulation results with analytical solutions or experimental

data.

- **Document your code:** Proper comments and modular functions improve readability and reusability.
