Sample Practice Questions Inspired by the May 2013 G481 Past Paper

Question 1:

A metal block with a mass of 200 g is heated from 20°C to 80°C. The specific heat capacity of the metal is 500 J/kg°C.

Calculate the amount of heat energy transferred to the block.

Answer:

First, convert mass to kg: 200 g = 0.2 kg

Change in temperature: $\Delta T = 80^\circ\text{C} - 20^\circ\text{C} = 60^\circ\text{C}$

Heat energy (Q) = mass $\times$ specific heat capacity $\times \Delta T$

$$Q = 0.2 \text{ kg} \times 500 \text{ J/kg}^\circ\text{C} \times 60^\circ\text{C} = 6000 \text{ J}$$

Question 2:

Describe how electromagnetic induction is used to generate electricity in a transformer.

Sample Answer:

Electromagnetic induction in a transformer involves passing an alternating current through the primary coil, which creates a changing magnetic field. This changing magnetic flux links with the secondary coil, inducing an alternating voltage according to Faraday's law. The voltage can be increased or decreased depending on the turns ratio of the coils. Transformers are used in power distribution to efficiently transfer electricity over long distances.
