Core Topics Covered in Lecture Notes

The lecture notes are structured around several core areas, each integral to understanding electrical systems and devices.

1. Electric Charge and Coulomb's Law

This foundational topic introduces the concept of electric charge, its properties, and the fundamental force between charges. Coulomb's Law quantitatively describes the force (F) between two point charges:

$$F = k_e \frac{|q_1 q_2|}{r^2}$$

$$F = k_e \frac{|q_1 q_2|}{r^2}$$

where:

where:

- (q_1, q_2) are the magnitudes of charges,
- (r) is the distance between charges,
- (k_e) is Coulomb's constant.

Understanding this law lays the groundwork for analyzing electric fields and potential.

2. Electric Fields and Electric Potential

Lecture notes delve into the concept of electric fields as vector fields representing the force exerted by charges on other charges in space. The electric field $\mathbf{E}$ due to a point charge is expressed as:

$$\mathbf{E} = k_e \frac{q}{r^2} \hat{\mathbf{r}}$$

Electric potential V , defined as electric potential energy per unit charge, is another key concept:

$$V = \frac{k_e q}{r}$$

These concepts are essential for understanding how electrical energy is stored and transmitted.

3. Electric Current and Circuits

This area introduces the flow of electric charge through conductive paths, characterized by current I :

$$I = \frac{dq}{dt}$$

Lecture notes detail circuit elements such as resistors, capacitors, and inductors, along with their symbolic representations. Fundamental laws include:

- Ohm's Law:

$$V = IR$$

$$V = IR$$

\]

- Kirchhoff's Laws:

- Voltage Law (KVL): Sum of voltages around a loop equals zero.
- Current Law (KCL): Sum of currents entering a junction equals sum leaving.

These laws form the basis of circuit analysis.

4. Electrical Power and Energy

Power considerations involve the rate of energy transfer:

\[

$$P = VI$$

\]

Lecture notes explore how power is dissipated in resistive elements, stored in reactive components (capacitors and inductors), and transferred in AC and DC systems.

\[

$$V(t) = V_m \cos(\omega t + \phi)$$

\]

\[

$$\tilde{V} = V_m e^{j\phi}$$

\]

This approach facilitates algebraic manipulation of impedance and admittance.

2. Differential Equations

Dynamic systems involving inductors and capacitors are modeled using differential equations, such as:

\[

$$L \frac{di}{dt} + Ri = V(t)$$

\]

Solutions to these equations reveal transient and steady-state behaviors.
