## Crystal Field Theory (CFT) and Bonding

Crystal Field Theory explains the bonding and color in coordination compounds through electrostatic interactions.

### Basic Concepts of CFT

- The central metal ion is surrounded by ligands which create an electric field.
- This field splits the degenerate d-orbitals into different energy levels.
- The extent of splitting depends on the nature of the metal and ligands.

### Octahedral Field Splitting

- In an octahedral field, the five d-orbitals split into two sets:  $t_{2g}$  (lower energy) and  $e_g$  (higher energy).
- The energy difference is denoted as  $\Delta_0$  (octahedral crystal field splitting energy).

## High Spin and Low Spin Complexes

- **High spin:** Electrons occupy higher energy orbitals due to weak field ligands, resulting in more unpaired electrons.
- **Low spin:** Electrons pair up in lower energy orbitals under strong field ligands.

## Magnetic Properties of Coordination Compounds

Magnetism provides insights into the electronic structure of complexes.

### Types of Magnetism

- **Paramagnetism:** Due to unpaired electrons, e.g.,  $[\text{Fe}(\text{CN})_6]^{4-}$ .
- **Diamagnetism:** All electrons are paired, e.g.,  $[\text{Ni}(\text{CO})_4]$ .

### Determining Magnetic Moment

- The magnetic moment ( $\mu$ ) is calculated using the spin-only formula:

$$\mu = \sqrt{n(n+2)} \text{ Bohr magnetons}$$

where  $n$  = number of unpaired electrons.
