

MATHBITS ANSWERS THE CANDY STORE Manual

mathbits answers the candy store is a popular resource for students and educators seeking comprehensive solutions and explanations for various math problems, including those found in classroom activities, homework assignments, and math competitions. One engaging topic that often appears in educational settings is the classic "Candy Store" problem, designed to challenge students' problem-solving skills, understanding of ratios, and logical reasoning. This article aims to provide an in-depth exploration of the "Candy Store" problem, including detailed solutions, strategies for solving similar problems, and tips for mastering math puzzles involving candies and other real-world contexts.

Understanding the "Candy Store" Problem

The "Candy Store" problem typically presents a scenario where a store sells candies in different quantities, prices, or combinations, and asks students to determine the cost, the number of candies, or the best way to purchase candies within a budget. These problems are excellent for practicing concepts such as ratios, unit rates, systems of equations, and optimization.

Example Scenario:

Suppose a candy store sells chocolates and gummies. The problem states:

> "At the candy store, chocolates cost \$2 per piece, and gummies cost \$1.50 per piece. If a customer wants to buy exactly 10 candies and spend no more than \$15, how many chocolates and gummies can they buy?"

This example introduces multiple variables, constraints, and the need for students to analyze the problem systematically.

Breaking Down the Candy Store Problem

To effectively solve candy store problems, it's essential to understand the typical elements involved:

1. Variables and Quantities

- Define variables for unknown quantities, such as:

- C = number of chocolates
- G = number of gummies

2. Constraints and Conditions

- Total candies: $C + G = 10$
- Total cost: $2C + 1.5G \leq 15$
- Non-negativity: $C, G \geq 0$

3. Goal or Question

- Find all possible combinations of candies that satisfy the constraints.
- Determine the maximum number of candies within the budget.
- Find the least expensive combination.

Step-by-Step Solution Approach

Solving candy store problems involves a systematic approach:

Step 1: Define Variables

Assign variables to the quantities you need to find. For instance:

- C for chocolates
- G for gummies

Step 2: Write the Equations and Inequalities

Using the problem's data:

- Total candies: $C + G = 10$
- Cost constraint: $2C + 1.5G \leq 15$

Step 3: Solve the System of Equations

- Express one variable in terms of the other:

$$[G = 10 - C]$$

- Substitute into the cost inequality:

$$[2C + 1.5(10 - C) \leq 15]$$

$$[2C + 15 - 1.5C \leq 15]$$

$$[(2C - 1.5C) + 15 \leq 15]$$

$$[0.5C + 15 \leq 15]$$

$$[0.5C \leq 0]$$

$$[C \leq 0]$$

Since (C) cannot be negative, the only solution here is $(C = 0)$, which implies:

$$- (G = 10 - 0 = 10)$$

Check if this satisfies the cost constraint:

$$[2(0) + 1.5(10) = 0 + 15 = 15]$$

Yes, it satisfies the budget exactly.

Result: The customer can buy 0 chocolates and 10 gummies.

Analyzing and Extending the Solution

While the above example yields a specific combination, many candy store problems involve more complex scenarios, such as:

- Buying at least a certain number of each type of candy.
- Getting the maximum or minimum number of candies within a budget.
- Considering discounts or special deals.

Strategies for these cases include:

- Graphical analysis of inequalities for feasible regions.
- Using systems of equations to find exact solutions.
- Applying linear programming techniques for optimization problems.
- Testing boundary points to find maximum or minimum values.

Common Types of Candy Store Problems and Solutions

Here are some typical problem types, along with their solution strategies:

Type 1: Fixed Quantity, Cost Calculation

- Problem: If you buy 3 chocolates and 4 gummies, what is the total cost?
- Solution: Multiply quantities by their prices and sum.

Type 2: Budget-Constrained Purchase

- Problem: How many candies can you buy with \$10 if chocolates are \$2 each and gummies are \$1.50 each?
- Solution: Maximize total candies without exceeding budget, often using inequalities and testing boundary points.

Type 3: Equal Cost or Quantity Conditions

- Problem: Find the number of chocolates and gummies such that the total cost equals \$12, and you buy exactly 8 candies.
- Solution: Set up equations and solve simultaneously.

Type 4: Optimization (Maximize or Minimize Candies)

- Problem: With \$20, buy as many candies as possible, where chocolates are \$2 and gummies are \$1.50.
- Solution: Use linear programming or systematic testing to find the maximum number of candies.

Tips for Solving Candy Store Problems Effectively

- Always define variables clearly to keep track of unknowns.

- Translate word problems into equations and inequalities to formalize the problem.
- Draw graphs when dealing with multiple inequalities to visualize feasible regions.
- Check boundary conditions for maximum or minimum solutions.
- Verify solutions by substituting back into original constraints.
- Practice different problem types to build a versatile problem-solving toolkit.
