- **Adjust Airflow:** Fine-tune primary and secondary air flows to achieve stable combustion conditions. Typically, secondary air is introduced after the bed is heated adequately.

### 2. Achieving Steady-State Operation

Once the initial startup steps are completed:

- **Monitor Combustion Parameters:** Keep an eye on bed temperature, excess air ratio, flue gas composition, and bed pressure.

- **Increase Combustion Intensity:** Gradually increase fuel feed rate while maintaining stable bed temperature and combustion efficiency.
- **Stabilize Flue Gas Emissions:** Ensure emissions are within permissible limits, adjusting air flow and fuel feed as needed.
- **Activate Electrostatic Precipitators or Bag Filters:** Once combustion is stable, activate particulate removal systems to control dust emissions.
