What Is Hypothyroidism?

Definition and Overview

Hypothyroidism is a medical condition characterized by the underactivity of the thyroid gland, resulting in insufficient production of thyroid hormones—primarily thyroxine (T4) and triiodothyronine (T3). These hormones play a crucial role in regulating metabolism, energy levels, and overall bodily functions.

Causes of Hypothyroidism

The condition can develop due to various reasons, including:

- Autoimmune diseases such as Hashimoto's thyroiditis
- Iodine deficiency
- Thyroid surgery or radiation therapy
- Congenital hypothyroidism
- Medications affecting thyroid function
- Pituitary gland disorders

Symptoms and Signs

Hypothyroidism manifests with a range of symptoms, which can vary in severity:

- Fatigue and weakness
- Weight gain
- Cold intolerance
- Constipation
- Dry skin and hair
- Depression and mood changes
- Memory problems and difficulty concentrating
- Swelling in the neck (goiter)
- Slowed heart rate

Diagnosis and Monitoring

Laboratory Tests

Diagnosing hypothyroidism involves blood tests to measure thyroid function:

- **TSH (Thyroid Stimulating Hormone):** Elevated levels often indicate hypothyroidism.
