Example:

A firm faces a total cost function $(TC = 50 + 10Q)$. If the market price is \$20 per unit, should the firm produce in the short run?

- A) Yes, because price exceeds average variable cost.
- B) No, because total costs are too high.
- C) Yes, because total revenue exceeds total cost.
- D) No, because the firm should shut down.

Correct answer: A) Yes, because price exceeds average variable cost $(AVC = \frac{TVC}{Q})$, where $(TVC = 10Q)$.

Question Which of the following best describes the concept of diminishing marginal utility? Diminishing marginal utility refers to the decrease in additional satisfaction a consumer derives from consuming an additional unit of a good or service. In a perfectly competitive market, which condition must hold true for firms to maximize profit? Firms maximize profit where marginal cost equals marginal revenue ($MC = MR$). What is the primary assumption behind the theory of consumer choice in intermediate microeconomics? Consumers are rational and aim to maximize their utility subject to their budget constraints. How does an increase in the price of a substitute good affect the demand for the original good? An increase in the price of a substitute typically leads to an increase in the demand for the original good. Which of the following best defines a 'public good'? A good that is non-excludable and non-rivalrous, meaning one person's consumption does not reduce

availability for others and people cannot be excluded from using it. In the context of market equilibrium, what is meant by 'deadweight loss'? Deadweight loss is the loss of economic efficiency when the equilibrium outcome is not Pareto optimal, often due to externalities or price controls. What does the concept of 'elasticity of demand' measure? Elasticity of demand measures the responsiveness of quantity demanded to a change in price. Which of the following describes a 'monopoly'? A market structure where a single firm dominates the entire market with no close substitutes, leading to market power. In game theory, what is a 'Nash equilibrium'? A situation where no player can improve their payoff by unilaterally changing their strategy, given the strategies of others.
