QuestionAnswer What is the formula to calculate the potential energy stored in a stretched wire in ICSE Class 10 Physics numericals? The potential energy (U) stored in a stretched wire is given by $U = \frac{1}{2} \times k \times x^2$, where k is the force constant (spring constant) and x is the extension or compression. How do you determine the final velocity of a body sliding down an inclined plane with friction, given initial velocity, incline angle, and friction coefficient? Use the energy or force analysis: $v^2 = u^2 + 2g s \sin\theta - 2\mu g s \cos\theta$, where u is initial velocity, s is the distance moved, θ is the incline angle, and μ is the coefficient of friction. In a simple pendulum, how is the time period affected if the length of the pendulum is doubled? The time period T is proportional to the square root of the length ($T \propto \sqrt{l}$). So, if the length is doubled, T increases by a factor of $\sqrt{2}$. Calculate the work done in stretching a wire by a small extension when the force-extension graph is a straight line. The work done $W = \frac{1}{2} \times \text{Force (F)} \times \text{extension (x)}$. If the graph is linear, the area under the graph (a triangle or rectangle) represents work done. How can you find the speed of a body after it slides down an inclined plane with friction, given the initial potential energy and work done against friction? Use energy conservation: $v = \sqrt{2(g h - \text{work done against friction})}$, where h is the height corresponding to potential energy, and work done = friction force $\times$ distance. In an ICSE numericals problem, how do you calculate the elastic potential energy stored in a stretched wire? Elastic potential energy = $\frac{1}{2} \times k \times x^2$, where k is the spring constant and x is the extension or compression. What is the relation between the period of a simple pendulum and the acceleration due to gravity, and how is it used in numericals? The period $T = 2\pi \sqrt{l/g}$. In numericals, rearranging gives $g = (4\pi^2 l) / T^2$ to calculate gravity based on measured period and length. How do you calculate the power developed in an electric circuit numericals involving work done and time? Power $P = \text{Work done (W)} / \text{Time (t)}$. In numericals, work done can be calculated as $W = \text{Voltage (V)} \times \text{Current (I)} \times \text{time}$ or using energy formulas. When calculating the speed of sound in a medium using a numerical problem, what key parameters are needed? You need the distance traveled by sound (d) and the time taken (t). Speed of sound $v = d / t$. The problem may also involve temperature-dependent formulas if applicable.
