Detailed Solutions to 2014 Enrichment Stage Problems

Below, we analyze some representative problems from the 2014 enrichment stage and provide comprehensive step-by-step solutions.

Problem 1: Probability Distribution and Expectation Calculation

Problem Statement:

Given a Dirichlet distribution $(\text{Dir}(\alpha_1, \alpha_2, \dots, \alpha_k))$, compute the expected value of a coordinate (X_i) .

Solution:

- Step 1: Recall the expectation formula for Dirichlet distribution:

$\backslash$

$$E[X_i] = \frac{\alpha_i}{\sum_{j=1}^k \alpha_j}$$

$\backslash$

- Step 2: Understand the proof:

The Dirichlet distribution is the conjugate prior for the multinomial distribution. Its expectation for the i -th component is derived from the properties of the Beta distribution (when $k=2$) and extended to the multivariate case.

- Step 3: Derive the expectation:

$\backslash$

$$E[X_i] = \int_S x_i \cdot f(x_1, \dots, x_k) \, dx$$

$\backslash$

where S is the simplex $\{(x_1, \dots, x_k) \mid x_j \geq 0, \sum x_j = 1\}$, and

$\backslash$

$$f(x_1, \dots, x_k) = \frac{1}{B(\alpha)} \prod_{j=1}^k x_j^{\alpha_j - 1}$$

$\backslash$

with

$\backslash$

$$B(\alpha) = \frac{\prod_{j=1}^k \Gamma(\alpha_j)}{\Gamma(\sum_{j=1}^k \alpha_j)}$$

\]

- Step 4: Use properties of the Dirichlet distribution:

The marginal distribution of (X_i) is Beta:

\[

$$X_i \sim \text{Beta}(\alpha_i, \sum_{j \neq i} \alpha_j)$$

\]

and thus,

\[

$$E[X_i] = \frac{\alpha_i}{\sum_{j=1}^k \alpha_j}$$

\]

Final Answer:

\[

\boxed{

$$E[X_i] = \frac{\alpha_i}{\sum_{j=1}^k \alpha_j}$$

}

\]

Problem 2: Convergence of Dirichlet Processes

Problem Statement:

Show that a sequence of Dirichlet processes $(\text{DP}(\alpha_n, H))$ converges weakly to a Dirichlet process $(\text{DP}(\alpha, H))$ as $(\alpha_n \rightarrow \alpha)$.

Solution:

- Step 1: Recall the definition of the Dirichlet process:

The Dirichlet process $(\text{DP}(\alpha, H))$ is a stochastic process where, for any finite measurable partition $(A_1, \dots, A_m)$,

$$(\mu(A_1), \dots, \mu(A_m)) \sim \text{Dir}(\alpha H(A_1), \dots, \alpha H(A_m))$$

- Step 2: Understand weak convergence:

Weak convergence of measures involves convergence of finite-dimensional distributions.

- Step 3: Use properties of the Dirichlet distribution:

Since the finite-dimensional distributions are Dirichlet distributions with parameters (α_n) , as $(\alpha_n \rightarrow \alpha)$, these distributions converge weakly to $(\text{Dir}(\alpha H(A_1), \dots, \alpha H(A_m)))$.

- Step 4: Apply the convergence theorem:

By the properties of the Dirichlet distribution and the projective limits, the corresponding measures $(\text{DP}(\alpha_n, H))$ converge weakly to $(\text{DP}(\alpha, H))$.

Final conclusion:

$$\boxed{\text{If } \alpha_n \rightarrow \alpha, \text{ then } \text{DP}(\alpha_n, H) \xrightarrow{w} \text{DP}(\alpha, H)}$$

Problem 3: Optimization Under Constraints with Dirichlet Priors

Problem Statement:

Suppose you have a Dirichlet prior $\text{Dir}(\alpha)$ over a probability vector $p = (p_1, \dots, p_k)$. You observe data $\{x_1, \dots, x_n\}$. Devise the posterior distribution and determine the maximum a posteriori (MAP) estimate for p .

Solution:

- Step 1: Write the likelihood function:

Assuming categorical data:

[

$$L(p) = \prod_{i=1}^n p_{x_i}$$

]

- Step 2: Write the prior:

[

$$\pi(p) = \frac{1}{B(\alpha)} \prod_{j=1}^k p_j^{\alpha_j - 1}$$

]

- Step 3: Derive the posterior:

By Bayes' theorem:

[

$$\text{Posterior} \propto L(p) \times \pi(p) = \prod_{i=1}^n p_{x_i} \times \prod_{j=1}^k p_j^{\alpha_j - 1}$$

]

which simplifies to:

$$\prod_{j=1}^k p_j^{\alpha_j - 1 + n_j}$$

where (n_j) is the count of observations with category (j) .

- Step 4: Recognize the form of the posterior:

The posterior distribution is a Dirichlet:

$$\text{Dir}(\alpha_1 + n_1, \dots, \alpha_k + n_k)$$

- Step 5: Find the MAP estimate:

The mode of the Dirichlet distribution (for $(\alpha_j + n_j > 1)$) is at:

$$p_j^{\text{MAP}} = \frac{\alpha_j + n_j - 1}{\sum_{i=1}^k (\alpha_i + n_i) - k}$$

Final answer:

$$\boxed{p_j^{\text{MAP}} = \frac{\alpha_j + n_j - 1}{\sum_{i=1}^k (\alpha_i + n_i) - k}}$$

\]

Designed for students with a solid foundation in undergraduate-level mathematics, the problems aim to foster a deeper understanding of core concepts through intricate problem scenarios.

Problem Overview and Objectives

While the specific problems from 2014 vary, their common traits include:

- Requiring innovative approaches rather than straightforward application of formulas.
- Demanding proof strategies such as induction, contradiction, or construction.
- Encouraging the synthesis of multiple mathematical ideas.

The overarching goal is to develop problem-solving agility, logical reasoning, and the ability to connect different mathematical domains seamlessly.

Key Problem Types and Their Analytical Solutions

In analyzing the solutions, it's instructive to categorize the problems into thematic groups:

- Prime Distribution and Divisibility Problems

Typical Problem Statement:

Given a large integer (N) , prove that there exists a prime (p) such that (p) divides $(N! + 1)$ and (p) exceeds a certain bound.

Solution Approach:

- Use of Bertrand's Postulate (Chebyshev's theorem): This guarantees the existence of primes within specific intervals, which is crucial for bounding the size of primes involved.
- Properties of factorials and modular arithmetic: Recognize that $(N! \equiv -1 \pmod{p})$ implies (p) divides $(N! + 1)$.
- Application of Wilson's Theorem: Since Wilson's theorem states that for a prime (p) , $((p-1)!$

$\equiv -1 \pmod{p}$). This helps in establishing constraints on potential primes dividing $(N! + 1)$.

Key Insight:

The problem reduces to analyzing the structure of primes relative to factorials and understanding how factorial growth constrains prime divisibility.

- Algebraic and Inequality-Based Problems

Typical Problem Statement:

Prove that for positive numbers (a, b, c) satisfying certain conditions, an inequality holds, or construct an extremal configuration.

Solution Approach:

- Application of classical inequalities: AM-GM, Cauchy-Schwarz, or Jensen's inequality to establish bounds.
- Parameterization and symmetry arguments: Simplify the problem by exploiting symmetry or substitution.
- Use of Lagrange multipliers: For optimization problems under constraints, this method helps identify maximum or minimum values.

Case Study:

Suppose the problem asks to minimize $(a + b + c)$ given constraints involving products like $(ab + bc + ca)$. The solution involves setting derivatives to zero, verifying critical points, and confirming the extremum.

- Combinatorial and Graph Theory Problems

Typical Problem Statement:

Design or analyze a graph with certain properties, such as coloring, paths, or connectivity, to prove an existence or non-existence statement.

Solution Approach:

- Use of combinatorial principles: Pigeonhole principle, inclusion-exclusion, or Hall's Marriage theorem.
- Coloring techniques: Applying chromatic number bounds or the probabilistic method.
- Structural arguments: Decomposing graphs into subgraphs or leveraging symmetry.

Example:

Proving that in any coloring of a complete graph (K_n) , a monochromatic triangle exists when (n) exceeds a certain value involves Ramsey's theorem and intricate combinatorial reasoning.
