- Convection: Covers both natural and forced convection, with detailed explanations of boundary layer theory, Nusselt number correlations, and empirical data for different geometries and flow regimes.
- Radiation: Explores electromagnetic radiation principles, Stefan-Boltzmann law, view factors, and radiative heat exchange between surfaces, including participating media.

This section establishes the necessary theoretical background, essential for understanding more advanced topics.

2. Heat Transfer Equipment and Applications

Here, the focus shifts to practical devices and systems that utilize heat transfer processes:

- Heat exchangers: Types (shell-and-tube, plate, adiabatic wheel), design principles, performance analysis, and fouling considerations.
- Condensers and evaporators: Operating principles, heat transfer characteristics, and design challenges.
- Radiators and cooling towers: Application-specific heat transfer considerations.
- Thermal insulation: Materials, properties, and design strategies to minimize heat loss.

Provides detailed design guidelines, typical performance data, and case studies for each equipment type.

3. Advanced Topics and Special Considerations

This section delves into complex and emerging areas:

- Transient heat transfer: Time-dependent problems, methods for solving unsteady conduction and convection.
- Multi-phase heat transfer: Boiling, condensation, and phase change processes.
- Microscale and nanoscale heat transfer: Emerging research on thermal transport at small scales, including phonon conduction and thermal interface materials.
- Heat transfer in porous media: Applications in filtration, insulation, and chemical reactors.
- Computational heat transfer: Numerical methods, CFD modeling, and simulation techniques.

This segment caters to advanced practitioners seeking cutting-edge knowledge.
