Introduction to Ankle Replacement Surgery

Ankle replacement surgery aims to restore joint function, alleviate pain, and improve mobility in patients suffering from ankle arthritis or joint damage. Unlike ankle fusion, which permanently immobilizes the joint, ankle arthroplasty preserves movement, allowing for a more natural gait and better quality of life.

Historical Perspective

The development of ankle replacements has seen numerous innovations, with the first attempts dating back to the 1970s. Early devices faced challenges such as implant loosening, wear, and limited longevity. Modern prostheses, guided by advanced imaging and biomechanical understanding, have improved outcomes significantly.

Indications for Ankle Replacement

- Failed previous ankle surgeries

Contraindications include active infection, poor bone stock, and severe deformities unsuitable for prosthetic implantation.

Components of Ankle Prostheses

Ankle replacement devices generally consist of three main components:

1. Tibial Component

- Usually made of metal (titanium or cobalt-chromium alloys)
- Designed to mimic the tibial plafond
- Often cemented or cementless fixation

2. Talus Component
