Sample Problems and Their Solutions from ApexVS Math of Finance Semester 2

Example 1: Calculating Compound Interest

Problem:

Calculate the amount accumulated after 3 years on a principal of \$10,000 at an annual compound interest rate of 5%, compounded quarterly.

Solution Steps:

- Identify variables:
 - Principal (P) = \$10,000
 - Rate (r) = 5% = 0.05
 - Time (t) = 3 years
 - Compounding periods per year (n) = 4
- Use compound interest formula:

\[

$$A = P \left(1 + \frac{r}{n}\right)^{nt}$$

\]

- Calculate:

\[

$$A = 10,000 \left(1 + \frac{0.05}{4}\right)^{4 \times 3} = 10,000 \left(1 + 0.0125\right)^{12}$$

\]

\[

$$A = 10,000 \times (1.0125)^{12}$$

\]

- Compute:

\[

$$(1.0125)^{12} \approx 1.16075$$

\]

- Final amount:

\[

$$A \approx 10,000 \times 1.16075 = \$11,607.50$$

\]

Answer:

The accumulated amount after 3 years is approximately \\$11,607.50.

Example 2: Valuing an Ordinary Annuity

Problem:

What is the present value of receiving \\$1,000 annually for 5 years at an annual discount rate of 6%?

Solution Steps:

- Identify variables:
- Payment (PMT) = \\$1,000
- Number of periods (n) = 5
- Discount rate (i) = 6% = 0.06
- Use present value of an ordinary annuity formula:

$\backslash$

$$PV = PMT \times \frac{1 - (1 + i)^{-n}}{i}$$

$\backslash$

- Calculate:

$\backslash$

$$PV = 1,000 \times \frac{1 - (1 + 0.06)^{-5}}{0.06}$$

$\backslash$

- Compute denominator:

$\backslash$

$$(1 + 0.06)^{-5} = (1.06)^{-5} \approx 0.7473$$

\]

- Plug in values:

\[

$$PV = 1,000 \times \frac{1 - 0.7473}{0.06} = 1,000 \times \frac{0.2527}{0.06} \approx 1,000 \times 4.2117 = \$4,211.70$$

\]

Answer:

The present value of the annuity is approximately \$4,211.70.

Sample Finance Aptitude Questions with Answers

1. Basic Financial Mathematics

Question: If the price of a stock increases from \$50 to \$60, what is the percentage increase?

Answer:

To calculate the percentage increase:

\[

$$\text{Percentage Increase} = \left(\frac{\text{New Price} - \text{Old Price}}{\text{Old Price}} \right) \times 100$$

\]

$$\left[\right.$$

$$= \left(\frac{60 - 50}{50} \right) \times 100 = \left(\frac{10}{50} \right) \times 100 = 20\%$$

$$\left. \right]$$

Therefore, the stock price increased by 20%.

2. Financial Ratios and Analysis

Question: A company's current assets are \$150,000, and current liabilities are \$50,000. What is the current ratio?

Answer:

Current ratio is calculated as:

$$\left[\right.$$

$$\text{Current Ratio} = \frac{\text{Current Assets}}{\text{Current Liabilities}} = \frac{150,000}{50,000} = 3$$

$$\left. \right]$$

The company's current ratio is 3:1, indicating good short-term liquidity.

3. Time Value of Money

Question: What is the future value of \$1,000 invested at an annual interest rate of 8% compounded annually for 3 years?

Answer:

Using the future value formula:

$$\left[\right.$$

$$FV = PV \times (1 + r)^n$$

$$\left. \right]$$

\[

$$FV = 1000 \times (1 + 0.08)^3 = 1000 \times (1.08)^3 \approx 1000 \times 1.2597 \approx \$1,259.72$$

\]

The future value is approximately \$1,259.72.

4. Profit and Loss Calculations

Question: A trader buys 100 shares at \$40 each and sells them at \$55 each. What is the total profit?

Answer:

Total profit:

\[

$$\text{Profit per share} = 55 - 40 = 15$$

\]

\[

$$\text{Total profit} = 15 \times 100 = \$1,500$$

\]

The trader makes a total profit of \$1,500.

5. Banking and Investment Concepts

Question: What is the difference between simple interest and compound interest?

Answer:

- Simple Interest: Calculated only on the principal amount for the entire period. Formula: $(SI = P \times r \times t)$.
- Compound Interest: Calculated on the principal and accumulated interest from previous periods.

Formula: $(FV = P \times (1 + r)^t)$.

Key distinction: Compound interest grows faster over time as interest earns interest.

6. Data Interpretation and Graphs

Question: Given a bar graph showing quarterly sales figures, how would you identify the quarter with the highest sales?

Answer:

- Examine the heights of the bars.
- The tallest bar represents the quarter with the highest sales.
- Note the specific quarter label to record the answer.

Tip: Always cross-verify with the data labels if available.

7. Logical and Analytical Reasoning

Question: If all finance managers are analysts, and some analysts are auditors, can we conclude that some finance managers are auditors?

Answer:

No, the conclusion cannot be definitively drawn based on the given information. The relationships are:

- All finance managers are analysts ($F \subset A$).
- Some analysts are auditors ($A \cap \text{Auditors} \neq \emptyset$).

However, this does not necessarily imply that some finance managers are auditors, as the subset of analysts who are auditors may not include any finance managers.

Tips for Preparing for Finance Aptitude Tests

Sample Questions and Detailed Solutions

To understand the nature of finance aptitude questions, let's examine some typical examples across various categories, along with step-by-step solutions.

Question 1: Simple Interest Calculation

Question:

A sum of \$5,000 is invested at an annual simple interest rate of 6%. What will be the interest accrued after 3 years?

Solution:

Simple Interest (SI) is calculated as:

$$SI = (\text{Principal} \times \text{Rate} \times \text{Time}) / 100$$

Applying the values:

$$SI = (5000 \times 6 \times 3) / 100$$

$$SI = (5000 \times 18) / 100$$

$$SI = 90000 / 100$$

$$SI = \$900$$

Answer:

The interest accrued after 3 years is \$900.

Question 2: Compound Interest Calculation

Question:

What will be the amount after 2 years if \$1,000 is invested at an annual compound interest rate of

8%, compounded annually?

Solution:

Compound Amount (A) is given by:

$$A = P(1 + r/100)^t$$

Where:

$$P = 1000$$

$$r = 8$$

$$t = 2$$

Calculating:

$$A = 1000 \times (1 + 8/100)^2$$

$$A = 1000 \times (1.08)^2$$

$$A = 1000 \times 1.1664$$

$$A = \$1,166.40$$

Answer:

The amount after 2 years will be \$1,166.40.

Question 3: Profit and Loss Problem

Question:

A shopkeeper sells an article at a profit of 20%. If the selling price is \$240, what is the cost price?

Solution:

$$\text{Profit percentage (P\%)} = (\text{Profit} / \text{Cost Price}) \times 100$$

Given:

Selling Price (SP) = \$240

Profit = 20% of Cost Price (CP)

Since $SP = CP + \text{Profit}$,

Profit = 20% of CP = $0.20 \times CP$

Therefore,

$SP = CP + 0.20 \times CP = 1.20 \times CP$

Rearranged:

$CP = SP / 1.20 = 240 / 1.20 = \200

Answer:

The cost price is \$200.

Question 4: Discount and Marked Price

Question:

A retailer offers a 10% discount on an article marked at \$150. What is the selling price after discount?

Solution:

Discount amount = 10% of marked price = $0.10 \times 150 = \$15$

Selling Price (SP) = Marked Price - Discount = $150 - 15 = \$135$

Answer:

The selling price after discount is \$135.

Question 5: Ratio and Proportion in Financial Context

Question:

The ratio of current assets to current liabilities of a company is 3:1. If current liabilities are \$50,000, what are the current assets?

Solution:

$$\text{Current Assets (CA) / Current Liabilities (CL)} = 3 / 1$$

$$\text{Given CL} = \$50,000,$$

$$\text{CA} = (3 / 1) \times 50,000 = 3 \times 50,000 = \$150,000$$

Answer:

Current assets amount to \$150,000.

An item is bought for \$50 and sold for \$70. What is the profit percentage?

Solution Strategy:

- Calculate profit: $\$70 - \$50 = \$20$
- Calculate profit percentage: $(\text{Profit} \div \text{Cost Price}) \times 100 = (\$20 \div \$50) \times 100 = 40\%$
- The profit percentage is 40%.

4. Simple and Compound Interest

Interest calculations are common in banking and investment questions. Knowing the difference between simple and compound interest is essential.

Simple Interest Sample Question:

Calculate the simple interest on \$1,000 at an annual interest rate of 5% over 3 years.

Solution Strategy:

- Use the formula: Simple Interest = Principal $\times$ Rate $\times$ Time
- Convert rate to decimal: 5% = 0.05
- Calculate: $\$1,000 \times 0.05 \times 3 = \150
- The interest earned is \$150.

Compound Interest Sample Question:

Calculate the compound interest on \$2,000 at an annual rate of 4% compounded annually over 2 years.

Solution Strategy:

- Use the compound interest formula: $A = P(1 + r)^t$
- Where P = principal, r = rate per period, t = time in years
- Calculate: $A = 2000 \times (1 + 0.04)^2 = 2000 \times 1.0816 = \2163.20
- Interest earned = $\$2163.20 - \$2000 = \$163.20$

Strategies for Solving Year 10 Consumer Arithmetic Questions

To excel in consumer arithmetic, students should develop effective problem-solving strategies.

1. Read the Question Carefully

Identify exactly what is being asked. Highlight key figures such as percentages, prices, rates, and time periods.

2. Break Down the Problem

- Interest: $\text{Simple Interest} = \text{Principal} \times \text{Rate} \times \text{Time}$
- Compound Interest: $A = P(1 + r)^t$

4. Practice Past Exam Questions

Consistent practice with previous year questions helps in understanding question patterns and improving accuracy and speed.

5. Keep Track of Units and Conversions

Year 10 Questions on Consumer Arithmetic: A Comprehensive Guide to Mastering the Basics

Consumer arithmetic is a fundamental component of mathematics that students encounter in Year 10. It encompasses the skills needed to understand and perform calculations related to shopping, budgeting, discounts, interest, and other everyday financial decisions. Mastering Year 10 questions on consumer arithmetic not only prepares students for exams but also equips them with practical skills for real-world financial literacy. In this guide, we will explore the types of questions commonly encountered, strategies for solving them, and tips to improve accuracy and confidence.

What Is Consumer Arithmetic?

Consumer arithmetic involves calculations that individuals use when making financial decisions. Typical topics include:

- Calculating discounts and sale prices
- Working out simple and compound interest
- Understanding profit and loss
- Comparing prices and unit rates
- Budgeting and expense calculations

These topics often appear as word problems or numerical questions in exams, requiring students to interpret real-world scenarios and perform appropriate calculations.

Common Year 10 Questions on Consumer Arithmetic

Understanding the typical questions can help students prepare effectively. Below are some common question types:

- Calculating Discounts and Sale Prices

Questions may ask for the discounted price of an item after a percentage discount is applied.

Example:

A jacket costs £80. It's on a 25% discount. What is the sale price?

- Working Out the Original Price from a Sale Price

Sometimes, you are given the sale price after discount and need to find the original price.

Example:

A TV is sold for £360 after a 10% discount. What was its original price?

- Price Comparisons and Unit Rates

Questions involve comparing prices to find the best deal, often by calculating the cost per unit.

Example:

Two packets of rice are available: one costs £2.50 for 1 kg, another costs £4 for 2 kg. Which is cheaper per kilogram?

- Calculating Simple and Compound Interest

These questions assess understanding of how interest accumulates over time.

Simple Interest Example:

A savings account earns 3% interest annually. How much interest will £1,200 earn in 3 years?

Compound Interest Example:

£1,000 is invested at 5% compound interest per year. What will be the amount after 2 years?

- Profit and Loss Calculations

Questions may involve determining profit or loss when selling goods.

Example:

A shopkeeper buys an item for £45 and sells it for £60. What is the profit?

Strategies for Solving Consumer Arithmetic Questions

To excel in Year 10 consumer arithmetic questions, students should adopt systematic strategies:

- Carefully Read and Highlight Key Information

Identify the important details such as prices, percentages, quantities, and time periods.

- Convert Percentages to Decimals or Fractions

For calculations involving discounts or interest, convert percentages to decimals to simplify calculations.

Example:

25% becomes 0.25, 3% becomes 0.03.

- Use Formulas Where Appropriate

Memorize and understand key formulas:

- Discounted Price:

$\text{Sale Price} = \text{Original Price} \times (1 - \text{Discount Percentage})$

- Interest:

$\text{Simple Interest} = \text{Principal} \times \text{Rate} \times \text{Time}$

$\text{Compound Interest} = \text{Principal} \times (1 + \text{Rate})^{\text{Time}} - \text{Principal}$

- Profit or Loss:

$\text{Profit} = \text{Selling Price} - \text{Cost Price}$

$\text{Loss} = \text{Cost Price} - \text{Selling Price}$

- Perform Step-by-Step Calculations

Break down multi-step problems into manageable parts to avoid mistakes.

- Check Units and Conversions

Ensure consistency in units, especially when comparing prices or calculating per-unit costs.

Practical Examples and Walkthroughs

Let's examine some typical Year 10 questions with detailed solutions:

Example 1:

A pair of shoes costs £120. During a sale, they are offered at a 30% discount. What is the sale price?

Solution:

- Convert discount to decimal: $30\% = 0.30$
- Calculate discount amount: $£120 \times 0.30 = £36$
- Subtract discount from original price: $£120 - £36 = £84$

Answer: The sale price is £84.

Example 2:

A laptop originally costs £900. It is discounted by 15%. Later, an additional 10% off is applied to the new price. What is the final price?

Solution:

- First discount: $£900 \times 0.15 = £135$
- Price after first discount: $£900 - £135 = £765$
- Second discount: $£765 \times 0.10 = £76.50$
- Final price: $£765 - £76.50 = £688.50$

Answer: The final price is £688.50.

Example 3:

James deposits £2,000 into a savings account that earns 4% simple interest annually. How much interest will he earn after 5 years?

Solution:

Interest = Principal $\times$ Rate $\times$ Time

$$\text{Interest} = £2,000 \times 0.04 \times 5 = £400$$

Answer: James will earn £400 interest after 5 years.

Tips for Success in Consumer Arithmetic

- Practice regularly: The more problems you solve, the more familiar you become with different question types.
- Make use of calculators carefully: Double-check calculations to avoid simple mistakes.
- Memorize key formulas: Quick recall saves time during exams.
- Understand the context: Read questions carefully to identify what is being asked.
- Check your answers: Always review calculations, especially when working with percentages and currencies.

Common Mistakes to Avoid

- Misreading percentages: Confusing 10% with 0.10 or 1%.
- Forgetting to convert percentages to decimals: Leading to incorrect calculations.
- Incorrect unit conversions: Such as mixing grams and kilograms without conversion.
- Rushing calculations: Leading to arithmetic errors; take your time to verify steps.
- Ignoring the question context: For example, mixing profit with interest calculations.

Final Thoughts

Year 10 questions on consumer arithmetic are designed not only to test mathematical skills but also to prepare students for practical financial decisions. Developing a clear understanding of discounts, interest calculations, unit comparisons, and profit/loss concepts is essential. By practicing a variety of problems, understanding the underlying formulas, and adopting a systematic approach, students can confidently tackle consumer arithmetic questions and improve their overall mathematical literacy.

Remember, the key to mastery is consistency and understanding. With diligent practice and strategic thinking, you will be well-equipped to excel in Year 10 consumer arithmetic questions and beyond.

Question What is the total cost of purchasing 3 items priced at \$15.50 each, including a 10% sales tax? First, calculate the total cost before tax: $3 \times \$15.50 = \46.50 . Then, calculate the sales tax: 10% of \$46.50 = \$4.65. Finally, add the tax to the original amount: $\$46.50 + \$4.65 = \$51.15$. The total cost is \$51.15. A store offers a 25% discount on an item costing \$80. What is the

discounted price? Calculate 25% of \$80: $0.25 \times \$80 = \20 . Then, subtract the discount from the original price: $\$80 - \$20 = \$60$. The discounted price is \$60. If a product's original price is \$120 and it is on sale with a 15% discount, what is the sale price? Calculate 15% of \$120: $0.15 \times \$120 = \18 . Then, subtract the discount from the original price: $\$120 - \$18 = \$102$. The sale price is \$102. A customer buys 2 notebooks at \$3.50 each and 1 pen costing \$1.20. What is the total amount spent before taxes? Total cost of notebooks: $2 \times \$3.50 = \7.00 . Cost of pen: \$1.20. Add both: $\$7.00 + \$1.20 = \$8.20$. The total amount spent is \$8.20. If a pair of shoes costs \$90 and there is a 20% VAT included, what is the net price before VAT? Let the net price be x . Since VAT is 20%, total price = $x + 0.20x = 1.20x$. Given total price is \$90, so $1.20x = \$90$. Solve for x : $x = \$90 \div 1.20 = \75 . The net price before VAT is \$75.

$$M = P \times \frac{r(1 + r)^n}{(1 + r)^n - 1}$$

$$M = P \times \frac{r(1 + r)^n}{(1 + r)^n - 1}$$

$$M = P \times \frac{r(1 + r)^n}{(1 + r)^n - 1}$$

where:

- $(P = 10000)$
- $(r = \frac{0.05}{12})$
- $(n = 5 \times 12 = 60)$

- Budgeting and financial planning scenarios

Core Concepts in Financial Math

To excel in answers ple platoweb financial math, you need a solid grasp of fundamental concepts. Let's break down some of the most important topics.

- Simple Interest

Simple interest is calculated on the principal amount only. The formula is:

$$\text{Interest (I)} = \text{Principal (P)} \times \text{Rate (r)} \times \text{Time (t)}$$

- Principal (P): The initial amount invested or loaned.
- Rate (r): The annual interest rate (expressed as a decimal).
- Time (t): The duration in years.

Example: If you deposit \$1,000 at 5% annual simple interest for 3 years:

$$I = 1000 \times 0.05 \times 3 = \$150$$

$$\text{Total amount} = \text{Principal} + \text{Interest} = \$1,000 + \$150 = \$1,150$$

- Compound Interest

Compound interest grows on the initial principal and accumulated interest. The formula:

$$A = P(1 + r/n)^{nt}$$

- A: The amount after time t
- n: Number of compounding periods per year

Example: \$1,000 invested at 5% compounded quarterly for 3 years:

$$A = 1000(1 + 0.05/4)^{(4 \times 3)} \approx \$1,161.62$$

Understanding the difference between simple and compound interest is vital for solving various financial problems.

- Loans and Amortization

Loan calculations often involve determining monthly payments, total interest paid, and payoff schedules.

Loan Payment Formula:

$$PMT = P \times [r(1 + r)^n] / [(1 + r)^n - 1]$$

- PMT: Monthly payment
- P: Loan principal
- r: Monthly interest rate
- n: Total number of payments

Example: A \$10,000 loan at 6% annual interest, paid over 3 years (36 months):

$$r = 0.06/12 = 0.005$$

$$PMT = 10000 \times [0.005(1 + 0.005)^{36}] / [(1 + 0.005)^{36} - 1] = \$304.22$$

- Present and Future Value

Calculating how much an investment is worth now (present value) or how much it will grow to in the future (future value) is fundamental.

Future Value (FV):

$$FV = PV \times (1 + r)^t$$

Present Value (PV):

$$PV = FV / (1 + r)^t$$

Example: What is the present value of \$1,000 to be received in 5 years at 4%?

$$PV = 1000 / (1 + 0.04)^5 = \$821.93$$

- Annuities and Perpetuities

Annuities involve regular payments over time, such as retirement savings. The formulas help determine the value of these series.

Ordinary Annuity:

$$PV = P \times [1 - (1 + r)^{-n}] / r$$

Future Value of Annuity:

$$FV = P \times [(1 + r)^n - 1] / r$$

Perpetuities are infinite series, often used for valuing certain financial instruments.

Essential Numerical Ability Formulae

Below is a comprehensive list of key formulae categorized by topic:

1. Number Systems & Basic Arithmetic

- LCM (Least Common Multiple):

For two numbers, a and b:

$$\text{LCM} = (a \times b) / \text{HCF (Highest Common Factor)}$$

- HCF (Highest Common Factor):

Prime factorization method or Euclid's Algorithm.

- Squares and Cubes:

$$-(a + b)^2 = a^2 + 2ab + b^2$$

$$-(a - b)^2 = a^2 - 2ab + b^2$$

$$-a^3 \pm b^3 = (a \pm b)(a^2 \mp ab + b^2)$$

- Squares ending with 5:

If a number ends with 5, say 25, 35, 45:

$$-\text{Square of a number ending with 5} = (\text{tens digit})(\text{tens digit} + 1)100 + 25$$

$$\text{Example: } 35^2 = (34)100 + 25 = 12100 + 25 = 12225$$

2. Percentages, Profit & Loss, Discount

- Percentage Increase/Decrease:

$$\% \text{ Change} = [(\text{New Value} - \text{Old Value}) / \text{Old Value}] \times 100$$

- Profit Percentage:

$$\text{Profit}\% = (\text{Profit} / \text{Cost Price}) \times 100$$

- Loss Percentage:

$$\text{Loss\%} = (\text{Loss} / \text{Cost Price}) \times 100$$

- Selling Price (SP):

$$\text{SP} = \text{Cost Price (CP)} + \text{Profit or - Loss}$$

- Marked Price (MP) & Discount:

$$\text{Discount} = \text{MP} - \text{SP}$$

$$\text{Discount\%} = (\text{Discount} / \text{MP}) \times 100$$

- Successive Discounts:

For discounts d1 and d2 on the marked price:

$$\text{Net Price} = \text{MP} \times (1 - d1/100) \times (1 - d2/100)$$

3. Time, Speed, and Distance

- Basic Formula:

$$\text{Distance} = \text{Speed} \times \text{Time}$$

- Conversions:

- Speed (km/hr) to m/sec: $(\text{km/hr}) \times (5/18)$

- Speed (m/sec) to km/hr: $(\text{m/sec}) \times (18/5)$

- Relative Speed:

- When moving in the same direction: Relative Speed = Difference of speeds

- When moving in opposite directions: Relative Speed = Sum of speeds

- Average Speed:

Average Speed = Total Distance / Total Time

- Problems involving trains, boats, and cycles often require these foundational formulas.

4. Time & Work

- Work done:

Work = Rate $\times$ Time

- Combined Work:

If A completes in x hours and B in y hours,

(A + B) together in 1 hour = $(1/x + 1/y)$

- Part-Work Problems:

Total work done by multiple persons = Sum of individual work rates

- Efficiency & Time:

Time taken when working together = $1 / (\text{Sum of individual work rates})$

5. Averages & Mixtures

- Average Formula:

Average = (Sum of observations) / Number of observations

- Weighted Average:

Weighted Average = (Sum of (value × weight)) / Sum of weights

- Mixture Problems:

Use alligation method or algebraic equations based on quantities and concentrations.

6. Ratios & Proportions

- Direct and Inverse Proportions:

- Direct: $a/b = c/d$

- Inverse: $a \times b = c \times d$

- Further Applications:

- Problems involving sharing, scaling, and proportionality

7. Partnership & Profit-Sharing

- Profit Sharing:

Share = (Capital × Time) or based on ratios directly

- Compound Partnership:

Use the formula for successive ratios or algebraic methods.

8. Simple & Compound Interest

- Simple Interest (SI):

$$SI = (P \times R \times T) / 100$$

- Compound Interest (CI):

$$CI = P(1 + R/100)^T - P$$

- Amount:

$$A = P(1 + R/100)^T$$

9. Data Interpretation & Data Sufficiency

- While formulae are less relevant here, understanding mean, median, mode, and data trends is essential.

10. Number Series & Sequences

- Recognizing patterns helps in quick solving; common sequences include arithmetic, geometric, and quadratic progressions.

Question What is the formula for calculating the compound interest in numerical ability? The compound interest formula is $A = P(1 + r/n)^{nt}$, where P = principal amount, r = annual interest rate (in decimal), n = number of times interest is compounded per year, t = time in years, and A = amount after interest. The compound interest earned is $A - P$. How do you calculate the percentage increase or decrease between two numbers? Percentage change = $[(\text{New Value} - \text{Original Value}) / \text{Original Value}] \times 100\%$. If the result is positive, it's a percentage increase; if negative, a decrease. What is the formula for work and time problems involving speed? Work = Speed $\times$ Time. For

combined work, total work done = sum of individual work rates, and total time = total work / combined rate. How do you find the average of a set of numbers? Average = Sum of all numbers / Total number of values. What is the formula for calculating profit percentage? Profit percentage = (Profit / Cost Price) $\times$ 100%. Profit = Selling Price - Cost Price. How is the ratio and proportion used in numerical ability questions? In ratio problems, the relation between quantities is expressed as a ratio, and in proportion problems, the equality of two ratios is used: $a/b = c/d$. What is the formula for simple interest? Simple Interest = (Principal $\times$ Rate $\times$ Time) / 100, where Principal is the initial amount, Rate is annual interest rate, and Time is in years. How do you solve problems involving ages using formulas? Use the relation: Present age = Past age + elapsed years, and set up equations based on given conditions. Commonly, age problems are solved by forming equations and solving for the unknown age. What is the formula for calculating speed in distance and time problems? Speed = Distance / Time. To find any unknown, rearrange the formula accordingly. How do you approach problems involving mixtures and allegations? Use the allegation method to find the ratio of components. The formula is (Higher % - Mean) / (Mean - Lower %) = Quantity of lower percentage / Quantity of higher percentage.
