Fundamental Concepts in Engineering Thermodynamics

Basic Definitions and Laws

Before delving into problem-solving techniques, it is essential to review the fundamental concepts and laws that underpin thermodynamics:

- System and Surroundings: The system is the portion of the universe under study; everything outside is the surroundings.
- Types of Systems: Open, closed, and isolated systems.
- Properties: Temperature, pressure, volume, internal energy, enthalpy, entropy, etc.
- Laws of Thermodynamics:
 - First Law: Conservation of energy.
 - Second Law: Entropy and the direction of processes.
 - Third Law: Absolute zero and entropy at absolute zero.

Understanding these principles is crucial for approaching any problem systematically.

Approach to Solving Thermodynamics Problems

Step 1: Read the Problem Carefully

- Identify what is given and what needs to be found.
- Note the type of system involved (open, closed).
- Recognize the process involved (isothermal, adiabatic, isobaric, etc.).

Step 2: Draw a Diagram

- Sketch the system and process.
- Mark all known and unknown parameters.

Step 3: List Known Data and Assumptions

- Write down given values.
- State any assumptions (ideal gas behavior, steady-state, etc.).

Step 4: Choose Relevant Equations and Principles

- Use appropriate thermodynamic equations based on the process and system.
- Apply the first law for energy calculations.
- Use the second law to evaluate entropy changes if necessary.

Step 5: Perform Calculations Step-by-Step

- Solve algebraically, maintaining clarity.
- Use consistent units.
- Check the reasonableness of results.

Step 6: Verify and Interpret Results

- Cross-verify with physical intuition.
- Confirm units and signs.
- Interpret the significance of the result in practical context.

Typical Problems and Solutions in PK Nag Thermodynamics

Problem 1: Isothermal Expansion of an Ideal Gas

Given:

A gas expands isothermally at 300 K from an initial volume of 0.5 m³ to a final volume of 1.0 m³. The gas is an ideal gas with a molar mass of 28 g/mol and an initial pressure of 200 kPa.

Find:

- The work done during expansion.
- The heat transferred to the gas.

Solution:

Step 1: Known Data

- Temperature, $T = 300 \text{ K}$
- Initial volume, $V_1 = 0.5 \text{ m}^3$
- Final volume, $V_2 = 1.0 \text{ m}^3$
- Initial pressure, $P_1 = 200 \text{ kPa}$
- Gas molar mass = 28 g/mol (or 0.028 kg/mol)

Step 2: Convert units where needed

- Use ideal gas law: $PV = nRT$

Calculate number of moles, n :

$$P_1 V_1 = n R T$$

Where $R = 8.314 \text{ J/mol}\cdot\text{K}$

$$n = \frac{P_1 V_1}{R T} = \frac{200,000 \times 0.5}{8.314 \times 300}$$

$$n \approx \frac{100,000}{2494.2} \approx 40.07 \text{ mol}$$

Step 3: Work done during isothermal process

For an ideal gas undergoing an isothermal process:

$$W_{12} = n R T \ln \frac{V_2}{V_1}$$

$$W_{12} = 40.07 \times 8.314 \times 300 \times \ln(2)$$

$$W_{12} = 40.07 \times 8.314 \times 300 \times 0.693$$

Calculate:

$$W_{12} \approx 40.07 \times 8.314 \times 300 \times 0.693$$

$$\approx 40.07 \times 8.314 \times 208$$

$$\approx 40.07 \times 1731.$$

$$W_{12} \approx 69,434 \text{ J} \text{ or } 69.43 \text{ kJ}$$

Step 4: Heat transferred (Q)

From the first law:

$$Q_{12} = \Delta U + W_{12}$$

But for an ideal gas, $(\Delta U = 0)$ during isothermal process.

Therefore,

$$Q_{12} = W_{12} \approx 69.43 \text{ kJ}$$

Result:

- Work done: 69.43 kJ
- Heat transferred to the gas: 69.43 kJ

Problem 2: Adiabatic Compression of an Air-Filled Cylinder

Given:

Air (assumed ideal gas, $\gamma = 1.4$) is compressed adiabatically from an initial state of 100 kPa and 27°C to a final pressure of 800 kPa. Find the final temperature.

Solution:

Step 1: Convert initial temperature to Kelvin

$$T_1 = 27 + 273 = 300 \text{ K}$$

Step 2: Use adiabatic relation for ideal gases

$$\frac{T_2}{T_1} = \left(\frac{P_2}{P_1}\right)^{(\gamma - 1)/\gamma}$$

$$T_2 = T_1 \times \left(\frac{P_2}{P_1}\right)^{(\gamma - 1)/\gamma}$$

Plugging in values:

$$T_2 = 300 \times \left(\frac{800}{100}\right)^{(1.4 - 1)/1.4}$$

$$T_2 = 300 \times (8)^{0.4/1.4}$$

Calculate the exponent:

$$0.4/1.4 \approx 0.2857$$

Calculate $(8^{0.2857})$:

$$8^{0.2857} = e^{0.2857 \times \ln 8}$$

$$(\ln 8 \approx 2.079)$$

$$e^{0.2857 \times 2.079} = e^{0.594} \approx 1.81$$

Now,

$$T_2 = 300 \times 1.81 \approx 543 \text{ K}$$

Convert back to Celsius:

$$T_2 - 273 \approx 270^\circ\text{C}$$

Result:

- Final temperature: 543 K (approximately 270°C)

Problem 3: Entropy Change in a Mixing Process

Given:

Two ideal gases, A and B, are initially separated at temperatures $(T_A = 300\text{ K})$ and $(T_B = 350\text{ K})$, with equal moles (1 mol each). The gases are then allowed to mix at constant pressure and volume. Find the total entropy change of the system.

Solution:

Step 1: Recognize that the process involves irreversible mixing

Total entropy change:

$$\Delta S_{\text{total}} = \Delta S_A + \Delta S_B$$

Since the gases are ideal, the entropy change for each gas when expanding or mixing at constant temperature is:

$$\Delta S = n R \ln \frac{V_{\text{final}}}{V_{\text{initial}}}$$

But in this case, the gases are initially separated and then mixed, so the entropy change per gas is:

$$\Delta S_i = n_i R \ln \frac{V_{\text{final}}}{V_{\text{initial},i}}$$

Alternatively, for mixing at constant pressure and temperature, the entropy change per gas is:

$$\Delta S_i = n_i R \ln \frac{V_{\text{final}}}{V_{\text{initial},i}}$$

However, since the gases are initially at different temperatures, the more accurate approach is to consider the entropy change for each gas expanding from initial to final state at constant pressure and temperature, and also account for the thermal effects.

Step 2: Use the entropy change for each ideal gas

The entropy change when an ideal gas expands or mixes from initial to final state:

$$\Delta S_i = n_i C_{p,i} \ln \frac{T_{\text{final}}}{T_{\text{initial},i}} + n_i R \ln \frac{V_{\text{final}}}{V_{\text{initial},i}}$$
