Solution:

- **Atomic Number (Z):** Equals the number of protons, so $Z = 6$.
- **Mass Number (A):** Sum of protons and neutrons, so $A = 6 + 8 = 14$.

Answer: Atomic number = 6, Mass number = 14. This isotope is Carbon-14.

Problem 2: Calculating Neutrons in an Isotope

An atom of oxygen has an atomic number of 8 and a mass number of 16. How many neutrons does it have?

Solution:

Analyzing Guided Practice Problems and Their Answers

Let's explore how expertly crafted guided practice problems and their detailed solutions operate as educational tools, emphasizing clarity, logical flow, and pedagogical value.

Sample Problem 1: Calculating Atomic Mass from Isotope Data

Question:

An element exists naturally as two isotopes: isotope A with a mass of 10.012 amu and an abundance of 20%, and isotope B with a mass of 11.009 amu and an abundance of 80%. What is the average atomic mass of this element?

Step-by-step Answer:

- Convert percentages to decimal abundances:
 - Isotope A: 20% = 0.20
 - Isotope B: 80% = 0.80
- Apply the average atomic mass formula:

\[

$$\text{Average atomic mass} = (m_A \times \text{abundance}_A) + (m_B \times \text{abundance}_B)$$

\]

- Calculate:

\[

$$(10.012 \times 0.20) + (11.009 \times 0.80) = 2.0024 + 8.8072 = 10.8096 \text{ amu}$$

\]

Final Answer:

The average atomic mass of the element is approximately 10.81 amu.

Educational value:

This problem demonstrates how natural isotope distribution influences atomic weight, reinforcing the importance of understanding isotopic abundance.

Question What are the main components of an atom's structure? An atom consists of protons, neutrons, and electrons. Protons and neutrons are located in the nucleus at the center, while electrons orbit the nucleus in various energy levels. How do you determine the number of protons, neutrons, and electrons in an atom? The number of protons is equal to the atomic number.

The number of neutrons can be found by subtracting the atomic number from the atomic mass (rounded to the nearest whole number). In a neutral atom, the number of electrons equals the number of protons. What is an isotope, and how does it relate to atomic structure? An isotope is an atom of the same element that has the same number of protons but a different number of neutrons, resulting in a different atomic mass. Isotopes have similar chemical properties but differ in mass and stability. How do you calculate the average atomic mass of an element with multiple isotopes? Multiply each isotope's atomic mass by its natural abundance (as a decimal), then sum these values. For example, average atomic mass = (mass of isotope 1 $\times$ abundance) + (mass of isotope 2 $\times$ abundance) + ... What is the significance of electron configuration in atomic structure? Electron configuration describes the distribution of electrons in an atom's orbitals, which determines the atom's chemical properties and reactivity. How do you interpret a simplified atomic orbital diagram? A simplified orbital diagram shows electrons as arrows in boxes representing orbitals, with opposite spins. It helps visualize how electrons occupy energy levels and orbitals in an atom. What is the relationship between atomic number and element identity? The atomic number uniquely identifies an element because it equals the number of protons in the nucleus of its atoms. How can guided practice problems help in understanding atomic structure? Guided practice problems provide step-by-step solutions and explanations, helping students grasp concepts like calculating atomic mass, electron configurations, and isotope distribution more effectively. What are common mistakes to avoid when solving atomic structure problems? Common mistakes include mixing up protons, neutrons, and electrons; forgetting to account for isotopes; misreading atomic mass; and confusing electron configurations or energy levels.
