Sample Past GCE Biology Alternative to Practical Questions

Below are illustrative examples of typical alternative practical questions along with approaches to answer them.

Example 1: Data Interpretation

Question:

The table below shows the effect of enzyme concentration on the rate of reaction.

Enzyme concentration (mg/mL)	Rate of reaction (units/min)
0.5	10
1.0	20
1.5	25
2.0	25

a) Explain the trend in the data.

b) Suggest reasons for the plateau observed at higher enzyme concentrations.

c) How would increasing substrate concentration affect the rate, assuming enzyme concentration remains constant?

Approach:

- For (a), discuss how increasing enzyme concentration initially increases the rate due to more active sites.

- For (b), explain substrate saturation and enzyme limitation leading to a plateau.

- For (c), relate to enzyme kinetics, where increasing substrate concentration increases rate until saturation.

Example 2: Experimental Design

Question:

Design an experiment to investigate the effect of light intensity on the rate of photosynthesis in pondweed.

Approach:

- State the aim: to determine how different light intensities affect photosynthesis rate.
- Identify variables: independent (light intensity), dependent (oxygen produced or bubbles counted), controlled (temperature, CO₂ concentration).
- Describe setup: pondweed in water, light source at varying distances or intensities, pause at set intervals.
- Outline procedure: measure oxygen output under different light conditions, ensure consistent duration, replicate for accuracy.
- Suggest data recording: count bubbles, measure oxygen volume, or use a dissolved oxygen meter.
- Indicate how to analyze data: plot light intensity vs. rate, identify the relationship.

Example 3: Evaluation of Experimental Limitations

Question:

A student conducted an experiment to measure the effect of temperature on enzyme activity. The temperature was increased gradually from 20°C to 70°C. The student observed that the rate increased up to 50°C and then declined sharply.

- Explain why the rate of enzyme activity increased with temperature up to 50°C.
- Discuss possible reasons for the decline in activity beyond 50°C.
- Suggest improvements to the experiment to obtain more reliable results.

Approach:

- For (a), mention increased kinetic energy leading to more effective enzyme-substrate collisions.
- For (b), discuss enzyme denaturation at high temperatures.
- For (c), recommend controlling temperature more precisely, using a water bath, or measuring enzyme concentration beforehand.
