Fundamentals of Engineering Fluid Mechanics

Fluid mechanics is the branch of physics that deals with the behavior of fluids at rest and in motion. Its principles are essential for designing systems involving fluid flow and for predicting how fluids will respond under various conditions.

Properties of Fluids

Understanding the properties of fluids is foundational to fluid mechanics. These properties include:

- Density (ρ): Mass per unit volume of a fluid, typically expressed in kg/m^3 . Density influences buoyancy, pressure, and flow characteristics.
- Viscosity (μ): A measure of a fluid's resistance to deformation or flow, often expressed in $\text{Pa}\cdot\text{s}$ or centipoise. Viscosity affects flow regime and energy losses.
- Pressure (p): The force exerted per unit area, influencing fluid movement and force transmission.
- Temperature: Impacts properties like viscosity and density, thereby affecting flow behavior.
- Surface Tension and Capillarity: Important in phenomena involving free surfaces, such as jets and droplets.

Fluid Statics

Fluid statics, or hydrostatics, deals with fluids at rest. Key concepts include:

- Hydrostatic Pressure: The pressure exerted by a fluid at a certain depth, given by $p = p_0 + \rho g h$, where p_0 is the atmospheric pressure, g is acceleration due to gravity, and h is depth.
- Pascal's Law: States that a change in pressure applied to an enclosed incompressible fluid is transmitted undiminished throughout the fluid, underpinning hydraulic systems.
- Buoyancy and Archimedes' Principle: An object submerged in a fluid experiences an upward buoyant force equal to the weight of displaced fluid.

Fluid Dynamics

Fluid dynamics focuses on fluids in motion, governed by the fundamental equations:

- Continuity Equation: Based on conservation of mass, it states that for incompressible flow, the product of cross-sectional area (A) and velocity (V) remains constant ($A_1 V_1 = A_2 V_2$).
- Bernoulli's Equation: A statement of conservation of energy for flowing fluids, relating pressure, velocity, and elevation:

$$p + \frac{1}{2} \rho V^2 + \rho g h = \text{constant}$$

- Navier-Stokes Equations: Differential equations describing the motion of viscous fluids, incorporating effects of viscosity, pressure, and external forces.

Flow Regimes and Critical Parameters

Flow can be classified as laminar or turbulent:

- Turbulent Flow: Chaotic, irregular flow with high velocities and ($Re > 4000$). Inertial forces dominate, leading to mixing and energy losses.

The Reynolds number (Re) is crucial in predicting flow regimes:

$$Re = \frac{\rho V D}{\mu}$$

where (V) is velocity, (D) is characteristic length (diameter), and (μ) is dynamic viscosity.
